1 Overview

The GTK+ wrapper for Guile is a part of Guile-GNOME. It's a good idea to read the GNOME documentation first. See Section “Contents” in Guile-GNOME: GObject.

1.1 Example usage

The following code can be found in the file gtk/examples/hello.scm in your distribution.

```scheme
(use-modules (oop goops) (gnome gobject) (gnome gtk))

;; define the app as a function -- there are many other ways to do
;; this, of course...

(define (hello)
  ;; every widget has a class. here we define a window and a button.
  (let* ((window (make <gtk-window> #:type 'toplevel))
         (button (make <gtk-button> #:label "Hello, World!")))

    (gtk-container-set-border-width window 10)
    (gtk-container-add window button)

    ;; of course you can attach a lambda to a signal :-)
    (gtype-instance-signal-connect button 'clicked
      (lambda (b) (gtk-main-quit)))

    (gtk-widget-show-all window)

  ;; this will block until gtk-main-quit is called...
  (gtk-main)))

;; meaning this blocks until the button is clicked.
(hello)
```

1.2 hello world, improved

There's something about this that resembles programming in C a little bit too much. In Python, you can just do `window.add(button)`. That's a lot less typing. In GOOPS, the object framework for Guile, methods are implemented a bit differently – See Section “(gnome gobject generics)” in Guile-Gnome: GObject. If we use the GOOPS methods, hello-generics.scm looks a bit different:

```scheme
(use-modules (oop goops) (gnome gobject) (gnome gtk)
             (gnome gobject utils))

(define (hello)
  (let* (((window (make <gtk-window> #:type 'toplevel))
           (button (make <gtk-button> #:label "Hello, World!")))

    (gtk-container-set-border-width window 10)
    (gtk-container-add window button)

    ;; of course you can attach a lambda to a signal :-)
    (gtype-instance-signal-connect button 'clicked
      (lambda (b) (gtk-main-quit)))

    (gtk-widget-show-all window)

  ;; this will block until gtk-main-quit is called...
  (gtk-main)))

;; meaning this blocks until the button is clicked.
(hello)
```
since window is a container, this generic maps onto the function

gtk-container-set-border-width

(set-border-width window 10)

; note that we can set the border width with a gobject property
; as well:

(gobject-set-property window 'border-width 15)

; (gnome gobject generics), re-exported by (gnome gtk), defines a
; generic 'set' method for gobject-set-property, so we can also
; do it like this:
(set window 'border-width 20)

; or, like this, using with-accessors from (gnome gobject utils):
(with-accessors (border-width)
  (set! (border-width window) 20))

; this is much less typing :-) (add window button)

; see (gnome gobject generics) for a full list of gobject generic
; functions
(connect button 'clicked (lambda (b) (gtk-main-quit)))

; generic functions for .defs apis are defined in the .defs files,
; not manually (show-all window)

(gtk-main)))

(hello)
Chapter 2:GtkDialog

2 GtkDialog

Create popup windows

2.1 Overview

Dialog boxes are a convenient way to prompt the user for a small amount of input, e.g. to display a message, ask a question, or anything else that does not require extensive effort on the user’s part.

GTK+ treats a dialog as a window split vertically. The top section is a <gtk-vbox>, and is where widgets such as a <gtk-label> or a <gtk-entry> should be packed. The bottom area is known as the action_area. This is generally used for packing buttons into the dialog which may perform functions such as cancel, ok, or apply. The two areas are separated by a <gtk-hseparator>.

<gtk-dialog> boxes are created with a call to gtk-dialog-new or gtk-dialog-new-with-buttons. gtk-dialog-new-with-buttons is recommended; it allows you to set the dialog title, some convenient flags, and add simple buttons.

If ‘dialog’ is a newly created dialog, the two primary areas of the window can be accessed as ‘GTK_DIALOG(dialog)->vbox’ and ‘GTK_DIALOG(dialog)->action_area’, as can be seen from the example, below.

A ’modal’ dialog (that is, one which freezes the rest of the application from user input), can be created by calling gtk-window-set-modal on the dialog. Use the gtk-window macro to cast the widget returned from gtk-dialog-new into a <gtk-window>. When using gtk-dialog-new-with-buttons you can also pass the <gtk-dialog-modal> flag to make a dialog modal.

If you add buttons to <gtk-dialog> using gtk-dialog-new-with-buttons, gtk-dialog-add-button, gtk-dialog-add-buttons, or gtk-dialog-add-action-widget, clicking the button will emit a signal called "response" with a response ID that you specified. GTK+ will never assign a meaning to positive response IDs; these are entirely user-defined. But for convenience, you can use the response IDs in the <gtk-response-type> enumeration (these all have values less than zero). If a dialog receives a delete event, the "response" signal will be emitted with a response ID of <gtk-response-delete-event>.

If you want to block waiting for a dialog to return before returning control flow to your code, you can call gtk-dialog-run. This function enters a recursive main loop and waits for the user to respond to the dialog, returning the response ID corresponding to the button the user clicked.

For the simple dialog in the following example, in reality you’d probably use <gtk-message-dialog> to save yourself some effort. But you’d need to create the dialog contents manually if you had more than a simple message in the dialog.

/* Function to open a dialog box displaying the message provided. */

void quick_message (gchar *message) {

GtkWidget *dialog, *label;
/* Create the widgets */
dialog = gtk_dialog_new_with_buttons("Message",
    main_application_window,
    GTK_DIALOG_DESTROY_WITH_PARENT,
    GTK_STOCK_OK,
    GTK_RESPONSE_NONE,
    NULL);
label = gtk_label_new(message);
/* Ensure that the dialog box is destroyed when the user responds. */
g_signal_connect_swapped(dialog,
    "response",
    G_CALLBACK (gtk_widget_destroy),
    dialog);
/* Add the label, and show everything we’ve added to the dialog. */
gtk_container_add(GTK_CONTAINER (GTK_DIALOG(dialog)->vbox),
    label);
gtk_widget_show_all(dialog);
}

2.2 Usage

<gtk-dialog> [Class]
Derives from <gtk-window>.
This class defines the following slots:

has-separator
The dialog has a separator bar above its buttons

response (arg0 <gint>) [Signal on <gtk-dialog>]
Emitted when an action widget is clicked, the dialog receives a delete event, or the application programmer calls gtk-dialog-response. On a delete event, the response ID is <gtk-response-none>. Otherwise, it depends on which action widget was clicked.

close [Signal on <gtk-dialog>]
gtk-dialog-run (self <gtk-dialog>) ⇒ (ret int) [Function]
run [Method]
Blocks in a recursive main loop until the dialog either emits the response signal, or is destroyed. If the dialog is destroyed during the call to gtk-dialog-run,
gtk_dialog_returns <gtk-response-none>. Otherwise, it returns the response ID from the "response" signal emission. Before entering the recursive main loop, gtk-dialog-run calls gtk-widget-show on the dialog for you. Note that you still need to show any children of the dialog yourself.

During gtk-dialog-run, the default behavior of "delete_event" is disabled; if the dialog receives "delete_event", it will not be destroyed as windows usually are, and gtk-dialog-run will return <gtk-response-delete-event>. Also, during gtk-dialog-run the dialog will be modal. You can force gtk-dialog-run to return at any time by calling gtk-dialog-response to emit the "response" signal. Destroying the dialog during gtk-dialog-run is a very bad idea, because your post-run code won’t know whether the dialog was destroyed or not.

After gtk-dialog-run returns, you are responsible for hiding or destroying the dialog if you wish to do so.

Typical usage of this function might be:

```c
  gint result = gtk_dialog_run (GTK_DIALOG (dialog));
  switch (result)
  {
    case GTK_RESPONSE_ACCEPT:
      do_application_specific_something ();
      break;
    default:
      do_nothing_since_dialog_was_cancelled ();
      break;
  }
  gtk_widget_destroy (dialog);
```

Note that even though the recursive main loop gives the effect of a modal dialog (it prevents the user from interacting with other windows in the same window group while the dialog is run), callbacks such as timeouts, IO channel watches, DND drops, etc, will be triggered during a gtk-dialog-run call.

```c
  dialog a <gtk-dialog>
  ret response ID
```

**gtk-dialog-response (self <gtk-dialog>) (response_id int) [Function]**

**response** [Method]

Emits the "response" signal with the given response ID. Used to indicate that the user has responded to the dialog in some way; typically either you or gtk-dialog-run will be monitoring the "response" signal and take appropriate action.

```c
  dialog a <gtk-dialog>
  response-id response ID
```
Chapter 2: GtKDialog

**gtk-dialog-add-button** *(self <gtk-dialog>) (button_text mchars)*  
(Function)  
(response_id int) ⇒ (ret <gtk-widget>)  
**add-button**  
[Method]  
Adds a button with the given text (or a stock button, if button-text is a stock ID) and sets things up so that clicking the button will emit the "response" signal with the given response-id. The button is appended to the end of the dialog’s action area. The button widget is returned, but usually you don’t need it.

*dialog*  
a <gtk-dialog>  

*button-text*  
text of button, or stock ID  

*response-id*  
response ID for the button  

*ret*  
the button widget that was added

**gtk-dialog-add-action-widget** *(self <gtk-dialog>)*  
(Function)  
(child <gtk-widget>) (response_id int)  
**add-action-widget**  
[Method]  
Adds an activatable widget to the action area of a <gtk-dialog>, connecting a signal handler that will emit the "response" signal on the dialog when the widget is activated. The widget is appended to the end of the dialog’s action area. If you want to add a non-activatable widget, simply pack it into the ‘action_area’ field of the <gtk-dialog> struct.

*dialog*  
a <gtk-dialog>  

*child*  
an activatable widget  

*response-id*  
response ID for child

**gtk-dialog-get-has-separator** *(self <gtk-dialog>)* ⇒ (ret bool)  
(Function)  
**get-has-separator**  
[Method]  
Accessor for whether the dialog has a separator.

*dialog*  
a <gtk-dialog>  

*ret*  
‘#t’ if the dialog has a separator

**gtk-dialog-set-default-response** *(self <gtk-dialog>)*  
(Function)  
(response_id int)  
**set-default-response**  
[Method]  
Sets the last widget in the dialog’s action area with the given response-id as the default widget for the dialog. Pressing "Enter" normally activates the default widget.

*dialog*  
a <gtk-dialog>  

*response-id*  
a response ID
Chapter 2: GtkDialog

```python
gtk-dialog-set-has-separator (self <gtk-dialog>) (setting bool) [Function]
set-has-separator [Method]
Sets whether the dialog has a separator above the buttons. ‘#t’ by default.
dialog a <gtk-dialog>
setting ‘#t’ to have a separator
```

```python
gtk-dialog-set-response-sensitive (self <gtk-dialog>)
(response_id int) (setting bool) [Function]
set-response-sensitive [Method]
Calls ‘gtk_widget_set_sensitive (widget, setting)’ for each widget in the
dialog’s action area with the given response-id. A convenient way to sensitize/desensitize
dialog buttons.
dialog a <gtk-dialog>
response-id a response ID
setting ‘#t’ for sensitive
```

```python
gtk-dialog-get-response-for-widget (self <gtk-dialog>)
(widget <gtk-widget>) ⇒ (ret int) [Function]
get-response-for-widget [Method]
Gets the response id of a widget in the action area of a dialog.
dialog a <gtk-dialog>
widget a widget in the action area of dialog
ret the response id of widget, or ‘GTK_RESPONSE_NONE’ if widget doesn’t have
a response id set.
```

Since 2.8

```python
gtk-alternative-dialog-button-order (screen <gdk-screen>) [Function]
⇒ (ret bool)
Returns ‘#t’ if dialogs are expected to use an alternative button order on the screen
screen. See gtk-dialog-set-alternative-button-order for more details about
alternative button order.
If you need to use this function, you should probably connect to the ::notify:gtk-
alternative-button-order signal on the <gtk-settings> object associated to screen,
in order to be notified if the button order setting changes.
screen a <gdk-screen>, or ‘#f’ to use the default screen
ret Whether the alternative button order should be used
```

Since 2.6
3 GtkInvisible

A widget which is not displayed

3.1 Overview

The `<gtk-invisible>` widget is used internally in GTK+, and is probably not very useful for application developers.

It is used for reliable pointer grabs and selection handling in the code for drag-and-drop.

3.2 Usage

```
<gtk-invisible> [Class]

Derives from `<gtk-widget>`. This class defines the following slots:

- screen: The screen where this window will be displayed

`gtk-invisible-new` ⇒ `(ret <gtk-widget>)` [Function]

Creates a new `<gtk-invisible>`.

`gtk-invisible-new-for-screen` `(screen <gdk-screen>)` ⇒ `(ret <gtk-widget>)` [Function]

Creates a new `<gtk-invisible>` object for a specified screen.

- screen: a `<gdk-screen>` which identifies on which the new `<gtk-invisible>` will be created.
- ret: a newly created `<gtk-invisible>` object

Since 2.2

`gtk-invisible-set-screen` `(self <gtk-invisible>) (screen <gdk-screen>)` [Function]

Sets the `<gdk-screen>` where the `<gtk-invisible>` object will be displayed.

- invisible: a `<gtk-invisible>`.
- screen: a `<gdk-screen>`.

Since 2.2

`gtk-invisible-get-screen` `(self <gtk-invisible>)` ⇒ `(ret <gdk-screen>)` [Method]

Returns the `<gdk-screen>` object associated with `invisible`

- invisible: a `<gtk-invisible>`.
- ret: the associated `<gdk-screen>`.

Since 2.2
```
4 GtkMessageDialog

A convenient message window

4.1 Overview

<gtk-message-dialog> presents a dialog with an image representing the type of message (Error, Question, etc.) alongside some message text. It’s simply a convenience widget; you could construct the equivalent of <gtk-message-dialog> from <gtk-dialog> without too much effort, but <gtk-message-dialog> saves typing.

The easiest way to do a modal message dialog is to use gtk-dialog-run, though you can also pass in the ‘GTK_DIALOG_MODAL’ flag, gtk-dialog-run automatically makes the dialog modal and waits for the user to respond to it. gtk-dialog-run returns when any dialog button is clicked.

```c
dialog = gtk_message_dialog_new (main_application_window,
    GTK_DIALOG_DESTROY_WITH_PARENT,
    GTK_MESSAGE_ERROR,
    GTK_BUTTONS_CLOSE,
    "Error loading file '%s': %s",
    filename, g_strerror (errno));

gtk_dialog_run (GTK_DIALOG (dialog));
gtk_widget_destroy (dialog);
```

You might do a non-modal <gtk-message-dialog> as follows:

```c
dialog = gtk_message_dialog_new (main_application_window,
    GTK_DIALOG_DESTROY_WITH_PARENT,
    GTK_MESSAGE_ERROR,
    GTK_BUTTONS_CLOSE,
    "Error loading file '%s': %s",
    filename, g_strerror (errno));

/* Destroy the dialog when the user responds to it (e.g. clicks a button) */
g_signal_connect_swapped (dialog, "response",
    G_CALLBACK (gtk_widget_destroy),
    dialog);
```

4.2 Usage

<gtk-message-dialog> [Class]

Derives from <gtk-dialog>.

This class defines the following slots:

- **message-type**
  - The type of message

- **buttons**
  - The buttons shown in the message dialog
text The primary text of the message dialog

use-markup The primary text of the title includes Pango markup.

secondary-text The secondary text of the message dialog

secondary-use-markup The secondary text includes Pango markup.

image The image

gtk-message-dialog-set-markup (self <gtk-message-dialog>) [Function]
(str mchars)

set-markup [Method]
Sets the text of the message dialog to be str, which is marked up with the Pango text markup language.

message-dialog a <gtk-message-dialog>

str markup string (see Pango markup format)

Since 2.4

gtk-message-dialog-set-image (self <gtk-message-dialog>) [Function]
(image <gtk-widget>)

set-image [Method]
Sets the dialog’s image to image.

dialog a <gtk-message-dialog>

image the image

Since 2.10
5 GtkWindow

Toplevel which can contain other widgets

5.1 Overview

5.2 Usage

<gtk-window> [Class]

Derives from <gtk-bin>.

This class defines the following slots:

type The type of the window

title The title of the window

startup-id

Unique startup identifier for the window used by startup-notification

role Unique identifier for the window to be used when restoring a session

allow-shrink

If TRUE, the window has no minimum size. Setting this to TRUE is
99% of the time a bad idea

allow-grow

If TRUE, users can expand the window beyond its minimum size

resizable

If TRUE, users can resize the window

modal If TRUE, the window is modal (other windows are not usable while this
one is up)

window-position

The initial position of the window

default-width

The default width of the window, used when initially showing the window

default-height

The default height of the window, used when initially showing the window

destroy-with-parent

If this window should be destroyed when the parent is destroyed

icon Icon for this window

icon-name Name of the themed icon for this window

screen The screen where this window will be displayed

type-hint

Hint to help the desktop environment understand what kind of window
this is and how to treat it.
skip-taskbar-hint
TRUE if the window should not be in the task bar.

skip-pager-hint
TRUE if the window should not be in the pager.

urgency-hint
TRUE if the window should be brought to the user’s attention.

accept-focus
TRUE if the window should receive the input focus.

focus-on-map
TRUE if the window should receive the input focus when mapped.

decorated
Whether the window should be decorated by the window manager

deletable
Whether the window frame should have a close button

gravity
The window gravity of the window

transient-for
The transient parent of the dialog

opacity
The opacity of the window, from 0 to 1

is-active
Whether the toplevel is the current active window

has-toplevel-focus
Whether the input focus is within this GtkWindow

set-focus (arg0 <gtk-widget>)
[Signal on <gtk-window>]

frame-event (arg0 <gdk-event>) ⇒ <gboolean>
[Signal on <gtk-window>]

activate-focus
[Signal on <gtk-window>]

activate-default
[Signal on <gtk-window>]

keys-changed
[Signal on <gtk-window>]

gtk-window-new (type <gtk-window-type>) ⇒ (ret <gtk-window>)  [Function]
Creates a new <gtk-window>, which is a toplevel window that can contain other widgets. Nearly always, the type of the window should be <gtk-window-toplevel>. If you’re implementing something like a popup menu from scratch (which is a bad idea, just use <gtk-menu>), you might use <gtk-window-popup>. <gtk-window-popup> is not for dialogs, though in some other toolkits dialogs are called "popups". In GTK+, <gtk-window-popup> means a pop-up menu or pop-up tooltip. On X11, popup windows are not controlled by the window manager.

If you simply want an undecorated window (no window borders), use gtk-window-set-decorated, don’t use <gtk-window-popup>.

type        type of window

ret        a new <gtk-window>.
Chapter 5: GtkWindow

gtk-window-set-title (self <gtk-window>) (title mchars) [Function]
set-title [Method]
Sets the title of the <gtk-window>. The title of a window will be displayed in its title bar; on the X Window System, the title bar is rendered by the window manager, so exactly how the title appears to users may vary according to a user’s exact configuration. The title should help a user distinguish this window from other windows they may have open. A good title might include the application name and current document filename, for example.

window a <gtk-window>
title title of the window

gtk-window-set-wmclass (self <gtk-window>) [Function]
set-wmclass [Method]
Don’t use this function. It sets the X Window System "class" and "name" hints for a window. According to the ICCCM, you should always set these to the same value for all windows in an application, and GTK+ sets them to that value by default, so calling this function is sort of pointless. However, you may want to call gtk-window-set-role on each window in your application, for the benefit of the session manager. Setting the role allows the window manager to restore window positions when loading a saved session.

window a <gtk-window>
wmclass-name window name hint
wmclass-class window class hint

gtk-window-set-resizable (self <gtk-window>) (resizable bool) [Function]
set-resizable [Method]
Sets whether the user can resize a window. Windows are user resizable by default.

window a <gtk-window>
resizable ‘#t’ if the user can resize this window

gtk-window-get-resizable (self <gtk-window>) ⇒ (ret bool) [Function]
get-resizable [Method]
Gets the value set by gtk-window-set-resizable.

window a <gtk-window>
ret ‘#t’ if the user can resize the window

gtk-window-add-accel-group (self <gtk-window>) [Function]
add-accel-group [Method]
Associate accel-group with window, such that calling gtk-accel-groups-activate on window will activate accelerators in accel-group.
window  window to attach accelerator group to

accel-group

a <gtk-accel-group>

**gtk-window-remove-accel-group** (*self* <gtk-window>)

(accel-group <gtk-accel-group>)

**remove-accel-group**

Reverses the effects of gtk-window-add-accel-group.

window  a <gtk-window>

accel-group

a <gtk-accel-group>

**gtk-window-activate-focus** (*self* <gtk-window>) ⇒ (ret bool)

**activate-focus**

Activates the current focused widget within the window.

window  a <gtk-window>

ret  ‘#t’ if a widget got activated.

**gtk-window-activate-default** (*self* <gtk-window>) ⇒ (ret bool)

**activate-default**

Activates the default widget for the window, unless the current focused widget has been configured to receive the default action (see `<gtk-receives-default>` in `<gtk-widget-flags>`), in which case the focused widget is activated.

window  a <gtk-window>

ret  ‘#t’ if a widget got activated.

**gtk-window-set-modal** (*self* <gtk-window>) (modal bool)

**set-modal**

Sets a window modal or non-modal. Modal windows prevent interaction with other windows in the same application. To keep modal dialogs on top of main application windows, use **gtk-window-set-transient-for** to make the dialog transient for the parent; most window managers will then disallow lowering the dialog below the parent.

window  a <gtk-window>

modal  whether the window is modal

**gtk-window-set-default-size** (*self* <gtk-window>) (width int) (height int)

**set-default-size**

Sets the default size of a window. If the window’s "natural" size (its size request) is larger than the default, the default will be ignored. More generally, if the default size does not obey the geometry hints for the window (**gtk-window-set-geometry-hints** can be used to set these explicitly), the default size will be clamped to the nearest permitted size.

Unlike **gtk-widget-set-size-request**, which sets a size request for a widget and thus would keep users from shrinking the window, this function only sets the initial
size, just as if the user had resized the window themselves. Users can still shrink the
window again as they normally would. Setting a default size of -1 means to use the
"natural" default size (the size request of the window).

For more control over a window’s initial size and how resizing works, investigate
`gtk-window-set-geometry-hints`.

For some uses, `gtk-window-resize` is a more appropriate function. `gtk-window-
resize` changes the current size of the window, rather than the size to be used on
initial display. `gtk-window-resize` always affects the window itself, not the geometry
widget.

The default size of a window only affects the first time a window is shown; if a window
is hidden and re-shown, it will remember the size it had prior to hiding, rather than
using the default size.

Windows can’t actually be 0x0 in size, they must be at least 1x1, but passing 0 for
`width` and `height` is OK, resulting in a 1x1 default size.

```
window a `<gtk-window>`
width width in pixels, or -1 to unset the default width
height height in pixels, or -1 to unset the default height
```

`gtk-window-set-gravity` ([Function]
`gtk-window-set-gravity`)

`set-gravity` ([Method]
`set-gravity`)

Window gravity defines the meaning of coordinates passed to `gtk-window-move`. See
`gtk-window-move` and `<gdk-gravity>` for more details.

The default window gravity is `<gdk-gravity-north-west>` which will typically "do
what you mean."

```
window a `<gtk-window>`
gravity window gravity
```

`gtk-window-get-gravity` ([Function]
`gtk-window-get-gravity`
 => `ret `<gdk-gravity>`

`get-gravity` ([Method]
`get-gravity`

Gets the value set by `gtk-window-set-gravity`.

```
window a `<gtk-window>`
ret window gravity
```

`gtk-window-set-position` ([Function]
`gtk-window-set-position`
`set-position `<gdk-window-position>`

`set-position` ([Method]
`set-position`

Sets a position constraint for this window. If the old or new constraint is
‘GTK_WIN_POS_CENTER_ALWAYS’, this will also cause the window to be repositioned
to satisfy the new constraint.

```
window a `<gtk-window>`.
position a position constraint.
```
**gtk-window-set-transient-for** (*self <gtk-window>*) [Function]

(*parent <gtk-window>*)

**set-transient-for** [Method]

Dialog windows should be set transient for the main application window they were spawned from. This allows window managers to e.g. keep the dialog on top of the main window, or center the dialog over the main window. `gtk-dialog-new-with-buttons` and other convenience functions in GTK+ will sometimes call `gtk-window-set-transient-for` on your behalf.

On Windows, this function will and put the child window on top of the parent, much as the window manager would have done on X.

```
window a <gtk-window>
pARENT parent window
```

**gtk-window-set-destroy-with-parent** (*self <gtk-window>*) [Function]

(*setting bool*)

**set-destroy-with-parent** [Method]

If `setting` is `#t`, then destroying the transient parent of `window` will also destroy `window` itself. This is useful for dialogs that shouldn’t persist beyond the lifetime of the main window they’re associated with, for example.

```
window a <gtk-window>
setting whether to destroy window with its transient parent
```

**gtk-window-set-screen** (*self <gtk-window>*) (*screen <gdk-screen>*) [Function]

**set-screen** [Method]

Sets the `<gdk-screen>` where the `window` is displayed; if the window is already mapped, it will be unmapped, and then remapped on the new screen.

```
window a <gtk-window>.
screen a <gdk-screen>.
```

Since 2.2

**gtk-window-get-screen** (*self <gtk-window>*) ⇒ (*ret <gdk-screen]*) [Function]

**get-screen** [Method]

Returns the `<gdk-screen>` associated with `window`.

```
window a <gtk-window>.
ret a <gdk-screen>.
```

Since 2.2

**gtk-window-is-active** (*self <gtk-window>*) ⇒ (*ret bool*) [Function]

**is-active** [Method]

Returns whether the window is part of the current active toplevel. (That is, the toplevel window receiving keystrokes.) The return value is `#t` if the window is active toplevel itself, but also if it is, say, a `<gtk-plug>` embedded in the active toplevel.

You might use this function if you wanted to draw a widget differently in an active window from a widget in an inactive window. See `gtk-window-has-toplevel-focus`
window  a <gtk-window>
ret          ‘#t’ if the window part of the current active window.

Since 2.4

gtk-window-has-toplevel-focus (self <gtk-window>) ⇒ (ret bool)  [Function]
has-toplevel-focus
Returns whether the input focus is within this GtWindow. For real toplevel windows,
this is identical to gtk-window-is-active, but for embedded windows, like <gtk-
plug>, the results will differ.

window  a <gtk-window>
ret          ‘#t’ if the input focus is within this GtWindow

Since 2.4

gtk-window-list-toplevels ⇒ (ret glist-of)                           [Function]
Returns a list of all existing toplevel windows. The widgets in the list are not individu-
ally referenced. If you want to iterate through the list and perform actions involving
callbacks that might destroy the widgets, you must call ‘g_list_foreach (result,
(GFunc)g_object_ref, NULL)’ first, and then unref all the widgets afterwards.

ret          list of toplevel widgets

gtk-window-add-mnemonic (self <gtk-window>)  [Function]
    (keyval unsigned-int) (target <gtk-widget>)
add-mnemonic
    Adds a mnemonic to this window.

window  a <gtk-window>
keyval  the mnemonic
target  the widget that gets activated by the mnemonic

gtk-window-remove-mnemonic (self <gtk-window>)  [Function]
    (keyval unsigned-int) (target <gtk-widget>)
remove-mnemonic
    Removes a mnemonic from this window.

window  a <gtk-window>
keyval  the mnemonic
target  the widget that gets activated by the mnemonic

gtk-window-mnemonic-activate (self <gtk-window>)  [Function]
    (keyval unsigned-int) (modifier <gdk-modifier-type>) ⇒ (ret bool)
mnemonic-activate
    Activates the targets associated with the mnemonic.

window  a <gtk-window>
keyval  the mnemonic
modifier  the modifiers
ret          ‘#t’ if the activation is done.
**gtk-window-activate-key** *(self <gtk-window>)*

*(event <gdk-event-key>)* ⇒ *(ret bool)*

**activate-key**

Activates mnemonics and accelerators for this `<gtk-window>`. This is normally called by the default ::key_press_event handler for toplevel windows, however in some cases it may be useful to call this directly when overriding the standard key handling for a toplevel window.

window a `<gtk-window>`

event a `<gdk-event-key>`

ret ‘#t’ if a mnemonic or accelerator was found and activated.

**gtk-window-propagate-key-event** *(self <gtk-window>)*

*(event <gdk-event-key>)* ⇒ *(ret bool)*

**propagate-key-event**

Propagate a key press or release event to the focus widget and up the focus container chain until a widget handles event. This is normally called by the default ::key_press_event and ::key_release_event handlers for toplevel windows, however in some cases it may be useful to call this directly when overriding the standard key handling for a toplevel window.

window a `<gtk-window>`

event a `<gdk-event-key>`

ret ‘#t’ if a widget in the focus chain handled the event.

**gtk-window-get-focus** *(self <gtk-window>)* ⇒ *(ret <gtk-widget>)*

**get-focus**

Retrieves the current focused widget within the window. Note that this is the widget that would have the focus if the toplevel window focused; if the toplevel window is not focused then ‘GTK_WIDGET_HAS_FOCUS (widget)’ will not be ‘#t’ for the widget.

window a `<gtk-window>`

ret the currently focused widget, or ‘#f’ if there is none.

**gtk-window-set-focus** *(self <gtk-window>) (focus <gtk-widget>)*

**set-focus**

If `focus` is not the current focus widget, and is focusable, sets it as the focus widget for the window. If `focus` is ‘#f’, unsets the focus widget for this window. To set the focus to a particular widget in the toplevel, it is usually more convenient to use `gtk-widget-grab-focus` instead of this function.

window a `<gtk-window>`

focus widget to be the new focus widget, or ‘#f’ to unset any focus widget for the toplevel window.
**gtk-window-set-default** (self <gtk-window>)

**set-default**
The default widget is the widget that’s activated when the user presses Enter in a dialog (for example). This function sets or unsets the default widget for a <gtk-window> about. When setting (rather than unsetting) the default widget it’s generally easier to call gtk-widget-grab-focus on the widget. Before making a widget the default widget, you must set the <gtk-can-default> flag on the widget you’d like to make the default using gtk-widget-set-flags.

*window*  a <gtk-window>

*default-widget*
   widget to be the default, or ‘#f’ to unset the default widget for the toplevel.

**gtk-window-present** (self <gtk-window>)

**present**
Presents a window to the user. This may mean raising the window in the stacking order, deiconifying it, moving it to the current desktop, and/or giving it the keyboard focus, possibly dependent on the user’s platform, window manager, and preferences.

*window*  a <gtk-window>

**gtk-window-present-with-time** (self <gtk-window>)

**present-with-time**
Presents a window to the user in response to a user interaction. If you need to present a window without a timestamp, use gtk-window-present. See gtk-window-present for details.

*window*  a <gtk-window>

*timestamp*
   the timestamp of the user interaction (typically a button or key press event) which triggered this call

Since 2.8

**gtk-window-iconify** (self <gtk-window>)

**iconify**
Asks to iconify (i.e. minimize) the specified window. Note that you shouldn’t assume the window is definitely iconified afterward, because other entities (e.g. the user or
window manager) could deiconify it again, or there may not be a window manager
in which case iconification isn’t possible, etc. But normally the window will end up
iconified. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window
will be iconified before it ever appears onscreen.

You can track iconification via the "window_state_event" signal on <gtk-widget>.

window  a <gtk-window>

```python
gtk-window-deiconify (self <gtk-window>) [Function]
deiconify [Method]
```

Asks to deiconify (i.e. unminimize) the specified window. Note that you shouldn’t
assume the window is definitely deiconified afterward, because other entities (e.g.
the user or window manager) could iconify it again before your code which assumes
deiconification gets to run.

You can track iconification via the "window_state_event" signal on <gtk-widget>.

window  a <gtk-window>

```python
gtk-window-stick (self <gtk-window>) [Function]
stick [Method]
```

Asks to stick window, which means that it will appear on all user desktops. Note
that you shouldn’t assume the window is definitely stuck afterward, because other
entities (e.g. the user or window manager) could unstick it again, and some window
managers do not support sticking windows. But normally the window will end up
stuck. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window.

You can track stickiness via the "window_state_event" signal on <gtk-widget>.

window  a <gtk-window>

```python
gtk-window-unstick (self <gtk-window>) [Function]
unstick [Method]
```

Asks to unstick window, which means that it will appear on only one of the user’s
desktops. Note that you shouldn’t assume the window is definitely unstuck afterward,
because other entities (e.g. the user or window manager) could stick it again. But
normally the window will end up stuck. Just don’t write code that crashes if not.

You can track stickiness via the "window_state_event" signal on <gtk-widget>.

window  a <gtk-window>

```python
gtk-window-maximize (self <gtk-window>) [Function]
maximize [Method]
```

Asks to maximize window, so that it becomes full-screen. Note that you shouldn’t
assume the window is definitely maximized afterward, because other entities (e.g. the
user or window manager) could unmaximize it again, and not all window managers
support maximization. But normally the window will end up maximized. Just don’t
write code that crashes if not.
It’s permitted to call this function before showing a window, in which case the window will be maximized when it appears onscreen initially.

You can track maximization via the "window_state_event" signal on <gtk-widget>.

```
window a <gtk-window>

gtk-window-unmaximize (self <gtk-window>)

Asks to unmaximize window. Note that you shouldn’t assume the window is definitely unmaximized afterward, because other entities (e.g. the user or window manager) could maximize it again, and not all window managers honor requests to unmaximize. But normally the window will end up unmaximized. Just don’t write code that crashes if not.

You can track maximization via the "window_state_event" signal on <gtk-widget>.

window a <gtk-window>

gtk-window-fullscreen (self <gtk-window>)

Asks to place window in the fullscreen state. Note that you shouldn’t assume the window is definitely full screen afterward, because other entities (e.g. the user or window manager) could unfullscreen it again, and not all window managers honor requests to full screen windows. But normally the window will end up full screen. Just don’t write code that crashes if not.

You can track the fullscreen state via the "window_state_event" signal on <gtk-widget>.

window a <gtk-window>

Since 2.2

gtk-window-unfullscreen (self <gtk-window>)

Asks to toggle off the fullscreen state for window. Note that you shouldn’t assume the window is definitely not full screen afterward, because other entities (e.g. the user or window manager) couldfullscreen it again, and not all window managers honor requests to unfullscreen windows. But normally the window will end up restored to its normal state. Just don’t write code that crashes if not.

You can track the fullscreen state via the "window_state_event" signal on <gtk-widget>.

window a <gtk-window>

Since 2.2

gtk-window-set-keep-above (self <gtk-window>) (setting bool)

Asks to keep window above, so that it stays on top. Note that you shouldn’t assume the window is definitely above afterward, because other entities (e.g. the user or window manager) could not keep it above, and not all window managers support
keeping windows above. But normally the window will end kept above. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be kept above when it appears onscreen initially.

You can track the above state via the "window_state_event" signal on <gtk-widget>. Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

```c
window a <gtk-window>
setting whether to keep window above other windows
```

Since 2.4

```c
gtk-window-set-keep-below (self <gtk-window>) (setting bool) [Function]
set-keep-below [Method]
```

Asks to keep window below, so that it stays in bottom. Note that you shouldn’t assume the window is definitely below afterward, because other entities (e.g. the user or window manager) could not keep it below, and not all window managers support putting windows below. But normally the window will be kept below. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be kept below when it appears onscreen initially.

You can track the below state via the "window_state_event" signal on <gtk-widget>. Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

```c
window a <gtk-window>
setting whether to keep window below other windows
```

Since 2.4

```c
gtk-window-begin-resize-drag (self <gtk-window>) [Function]
(begin edge <gdk-window-edge>) (button int) (root_x int) (root_y int) (timestamp unsigned-int32)
begin-resize-drag [Method]
```

Starts resizing a window. This function is used if an application has window resizing controls. When GDK can support it, the resize will be done using the standard mechanism for the window manager or windowing system. Otherwise, GDK will try to emulate window resizing, potentially not all that well, depending on the windowing system.

```c
window a <gtk-window>
edge position of the resize control
button mouse button that initiated the drag
```
root-x  
X position where the user clicked to initiate the drag, in root window coordinates

root-y  
Y position where the user clicked to initiate the drag

timestamp  
timestamp from the click event that initiated the drag

gtk-window-begin-move-drag  
(self <gtk-window>) (button int)
(root-x int) (root-y int) (timestamp unsigned-int32)

begin-move-drag  
Starts moving a window. This function is used if an application has window movement grips. When GDK can support it, the window movement will be done using the standard mechanism for the window manager or windowing system. Otherwise, GDK will try to emulate window movement, potentially not all that well, depending on the windowing system.

window  
a <gtk-window>

button  
mouse button that initiated the drag

root-x  
X position where the user clicked to initiate the drag, in root window coordinates

root-y  
Y position where the user clicked to initiate the drag

timestamp  
timestamp from the click event that initiated the drag

gtk-window-set-decorated  
(self <gtk-window>) (setting bool)

set-decorated  
By default, windows are decorated with a title bar, resize controls, etc. Some window managers allow GTK+ to disable these decorations, creating a borderless window. If you set the decorated property to ‘#f’ using this function, GTK+ will do its best to convince the window manager not to decorate the window. Depending on the system, this function may not have any effect when called on a window that is already visible, so you should call it before calling gtk-window-show.

On Windows, this function always works, since there’s no window manager policy involved.

window  
a <gtk-window>

setting  
‘#t’ to decorate the window

gtk-window-set-deletable  
(self <gtk-window>) (setting bool)

set-deletable  
By default, windows have a close button in the window frame. Some window managers allow GTK+ to disable this button. If you set the deletable property to ‘#f’ using this function, GTK+ will do its best to convince the window manager not to show a close button. Depending on the system, this function may not have any effect when called on a window that is already visible, so you should call it before calling gtk-window-show.

On Windows, this function always works, since there’s no window manager policy involved.
window  a `<gtk-window>`

setting  ‘#t’ to decorate the window as deletable

Since 2.10

`gtk-window-set-frame-dimensions (self <gtk-window>) (left int) (top int) (right int) (bottom int)`  [Function]

`set-frame-dimensions`  [Method]

(Note: this is a special-purpose function intended for the framebuffer port; see `gtk-window-set-has-frame`. It will have no effect on the window border drawn by the window manager, which is the normal case when using the X Window system.)

For windows with frames (see `gtk-window-set-has-frame`) this function can be used to change the size of the frame border.

window  a `<gtk-window>` that has a frame

left  The width of the left border

top  The height of the top border

right  The width of the right border

bottom  The height of the bottom border

`gtk-window-set-has-frame (self <gtk-window>) (setting bool)`  [Function]

`set-has-frame`  [Method]

(Note: this is a special-purpose function for the framebuffer port, that causes GTK+ to draw its own window border. For most applications, you want `gtk-window-set-decorated` instead, which tells the window manager whether to draw the window border.)

If this function is called on a window with setting of ‘#t’, before it is realized or showed, it will have a "frame" window around `window->window`, accessible in `window->frame`. Using the signal `frame-event` you can receive all events targeted at the frame.

This function is used by the linux-fb port to implement managed windows, but it could conceivably be used by X-programs that want to do their own window decorations.

window  a `<gtk-window>`

setting  a boolean

`gtk-window-set-mnemonic-modifier (self <gtk-window>) (modifier <gdk-modifier-type>)`  [Function]

`set-mnemonic-modifier`  [Method]

Sets the mnemonic modifier for this window.

window  a `<gtk-window>`

modifier  the modifier mask used to activate mnemonics on this window.

`gtk-window-set-role (self <gtk-window>) (role mchars)`  [Function]

`set-role`  [Method]

This function is only useful on X11, not with other GTK+ targets.
In combination with the window title, the window role allows a window manager to identify "the same" window when an application is restarted. So for example you might set the "toolbox" role on your app’s toolbox window, so that when the user restarts their session, the window manager can put the toolbox back in the same place.

If a window already has a unique title, you don’t need to set the role, since the WM can use the title to identify the window when restoring the session.

\begin{verbatim}
window a <gtk-window>
role unique identifier for the window to be used when restoring a session
\end{verbatim}

\begin{verbatim}
gtk-window-set-type-hint (self <gtk-window>) (hint <gdk-window-type-hint>)

set-type-hint
By setting the type hint for the window, you allow the window manager to decorate and handle the window in a way which is suitable to the function of the window in your application.

This function should be called before the window becomes visible.

gtk-dialog-new-with-buttons and other convenience functions in GTK+ will sometimes call gtk-window-set-type-hint on your behalf.

window a <gtk-window>

hint the window type
\end{verbatim}

\begin{verbatim}
gtk-window-set-skip-taskbar-hint (self <gtk-window>) (setting bool)

set-skip-taskbar-hint
Windows may set a hint asking the desktop environment not to display the window in the task bar. This function sets this hint.

window a <gtk-window>

setting ‘#t’ to keep this window from appearing in the task bar

Since 2.2
\end{verbatim}

\begin{verbatim}
gtk-window-set-skip-pager-hint (self <gtk-window>) (setting bool)

set-skip-pager-hint
Windows may set a hint asking the desktop environment not to display the window in the pager. This function sets this hint. (A "pager" is any desktop navigation tool such as a workspace switcher that displays a thumbnail representation of the windows on the screen.)

window a <gtk-window>

setting ‘#t’ to keep this window from appearing in the pager

Since 2.2
\end{verbatim}
Chapter 5: GtkWindow

**gtk-window-set-urgency-hint** (*self* &lt;gtk-window&gt;) (*setting* bool)  
*Function*

*set-urgency-hint*

Windows may set a hint asking the desktop environment to draw the users attention to the window. This function sets this hint.

*window*  a &lt;gtk-window&gt;

*setting*  ‘#t’ to mark this window as urgent

Since 2.8

**gtk-window-set-accept-focus** (*self* &lt;gtk-window&gt;) (*setting* bool)  
*Function*

*set-accept-focus*

Windows may set a hint asking the desktop environment not to receive the input focus. This function sets this hint.

*window*  a &lt;gtk-window&gt;

*setting*  ‘#t’ to let this window receive input focus

Since 2.4

**gtk-window-set-focus-on-map** (*self* &lt;gtk-window&gt;) (*setting* bool)  
*Function*

*set-focus-on-map*

Windows may set a hint asking the desktop environment not to receive the input focus when the window is mapped. This function sets this hint.

*window*  a &lt;gtk-window&gt;

*setting*  ‘#t’ to let this window receive input focus on map

Since 2.6

**gtk-window-get-decorated** (*self* &lt;gtk-window&gt;) ⇒ (*ret* bool)  
*Function*

*get-decorated*

Returns whether the window has been set to have decorations such as a title bar via gtk-window-set-decorated.

*window*  a &lt;gtk-window&gt;

*ret*  ‘#t’ if the window has been set to have decorations

**gtk-window-get-deletable** (*self* &lt;gtk-window&gt;) ⇒ (*ret* bool)  
*Function*

*get-deletable*

Returns whether the window has been set to have a close button via gtk-window-set-deletable.

*window*  a &lt;gtk-window&gt;

*ret*  ‘#t’ if the window has been set to have a close button

Since 2.10

**gtk-window-get-default-icon-list** ⇒ (*ret* glist-of)  
*Function*

Gets the value set by gtk-window-set-default-icon-list. The list is a copy and should be freed with **g-list-free**, but the pixbufs in the list have not had their reference count incremented.

*ret*  copy of default icon list
**GtkWindow**

Chapter 5:GtkWindow 27

### gtk-window-get-default-size

```
gtk-window-get-default-size (self <gtk-window>) ⇒ (width int) (height int)
```

**Method**

Gets the default size of the window. A value of -1 for the width or height indicates that a default size has not been explicitly set for that dimension, so the "natural" size of the window will be used.

- **window** <gtk-window>
- **width** location to store the default width, or ‘#f’
- **height** location to store the default height, or ‘#f’

### gtk-window-get-destroy-with-parent

```
gtk-window-get-destroy-with-parent (self <gtk-window>) ⇒ (ret bool)
```

**Method**

Returns whether the window will be destroyed with its transient parent. See gtk-window-set-destroy-with-parent.

- **window** <gtk-window>
- **ret** ‘#t’ if the window will be destroyed with its transient parent.

### gtk-window-get-frame-dimensions

```
gtk-window-get-frame-dimensions (self <gtk-window>) ⇒ (left int) (top int) (right int) (bottom int)
```

**Method**

Retrieves the dimensions of the frame window for this toplevel. See gtk-window-set-has-frame, gtk-window-set-frame-dimensions.

- **window** <gtk-window>
- **left** location to store the width of the frame at the left, or ‘#f’
- **top** location to store the height of the frame at the top, or ‘#f’
- **right** location to store the width of the frame at the returns, or ‘#f’
- **bottom** location to store the height of the frame at the bottom, or ‘#f’

### gtk-window-get-has-frame

```
gtk-window-get-has-frame (self <gtk-window>) ⇒ (ret bool)
```

**Method**

Accessor for whether the window has a frame window exterior to window->window. Gets the value set by gtk-window-set-has-frame.

- **window** <gtk-window>
- **ret** ‘#t’ if a frame has been added to the window via gtk-window-set-has-frame.
lenmiş dokümanın metni:

**Chapter 5: GtkWindow**

```
gtk-window-get-icon (self <gtk-window>) ⇒ (ret <gdk-pixbuf>)  [Function]
get-icon
Gets the value set by gtk-window-set-icon (or if you’ve called
gtk-window-set-icon-list, gets the first icon in the icon list).

window a <gtk-window>
ret icon for window

```  

```
gtk-window-get-icon-list (self <gtk-window>) ⇒ (ret glist-of)  [Function]
get-icon-list
Retrieves the list of icons set by gtk-window-set-icon-list. The list is copied, but
the reference count on each member won’t be incremented.

window a <gtk-window>
ret copy of window’s icon list

```  

```
gtk-window-get-icon-name (self <gtk-window>) ⇒ (ret mchars)  [Function]
get-icon-name
Returns the name of the themed icon for the window, see gtk-window-set-icon-name.

window a <gtk-window>
ret the icon name or ‘#f’ if the window has no themed icon
Since 2.6

```  

```
gtk-window-get-mnemonic-modifier (self <gtk-window>) ⇒ (ret gdk-modifier-type)  [Function]
get-mnemonic-modifier
Returns the mnemonic modifier for this window. See gtk-window-set-mnemonic-modifier.

window a <gtk-window>
ret the modifier mask used to activate mnemonics on this window.

```  

```
gtk-window-get-modal (self <gtk-window>) ⇒ (ret bool)  [Function]
get-modal
Returns whether the window is modal. See gtk-window-set-modal.

window a <gtk-window>
ret ‘#t’ if the window is set to be modal and establishes a grab when shown

```  

```
gtk-window-get-position (self <gtk-window>) ⇒ (root_x int)
(root_y int)  [Function]
get-position
This function returns the position you need to pass to gtk-window-move to keep
window in its current position. This means that the meaning of the returned value
varies with window gravity. See gtk-window-move for more details.

If you haven’t changed the window gravity, its gravity will be <gdk-gravity-north-west>. This means that gtk-window-get-position gets the position of the top-left
corner of the window manager frame for the window. `gtk-window-move` sets the position of this same top-left corner.

`gtk-window-get-position` is not 100% reliable because the X Window System does not specify a way to obtain the geometry of the decorations placed on a window by the window manager. Thus GTK+ is using a "best guess" that works with most window managers.

Moreover, nearly all window managers are historically broken with respect to their handling of window gravity. So moving a window to its current position as returned by `gtk-window-get-position` tends to result in moving the window slightly. Window managers are slowly getting better over time.

If a window has gravity `<gdk-gravity-static>` the window manager frame is not relevant, and thus `gtk-window-get-position` will always produce accurate results. However you can’t use static gravity to do things like place a window in a corner of the screen, because static gravity ignores the window manager decorations.

If you are saving and restoring your application’s window positions, you should know that it’s impossible for applications to do this without getting it somewhat wrong because applications do not have sufficient knowledge of window manager state. The Correct Mechanism is to support the session management protocol (see the "Gnome-Client" object in the GNOME libraries for example) and allow the window manager to save your window sizes and positions.

```
window a <gtk-window>
root-x return location for X coordinate of gravity-determined reference point
root-y return location for Y coordinate of gravity-determined reference point
```

gtk-window-get-role (self <gtk-window>) ⇒ (ret mchars) [Function]
get-role
Returns the role of the window. See `gtk-window-set-role` for further explanation.

```
window a <gtk-window>
ret the role of the window if set, or '#f'. The returned is owned by the widget
and must not be modified or freed.
```

gtk-window-get-size (self <gtk-window>) ⇒ (width int) [Function]
get-size
Obtains the current size of window. If `window` is not onscreen, it returns the size GTK+ will suggest to the window manager for the initial window size (but this is not reliably the same as the size the window manager will actually select). The size obtained by `gtk-window-get-size` is the last size received in a `<gdk-event-configure>`, that is, GTK+ uses its locally-stored size, rather than querying the X server for the size. As a result, if you call `gtk-window-resize` then immediately call `gtk-window-get-size`, the size won’t have taken effect yet. After the window manager processes the resize request, GTK+ receives notification that the size has changed via a configure event, and the size of the window gets updated.

Note 1: Nearly any use of this function creates a race condition, because the size of the window may change between the time that you get the size and the time that you
perform some action assuming that size is the current size. To avoid race conditions, connect to "configure_event" on the window and adjust your size-dependent state to match the size delivered in the <gdk-event-configure>.

Note 2: The returned size does not include the size of the window manager decorations (aka the window frame or border). Those are not drawn by GTK+ and GTK+ has no reliable method of determining their size.

Note 3: If you are getting a window size in order to position the window onscreen, there may be a better way. The preferred way is to simply set the window’s semantic type with gtk-window-set-type-hint, which allows the window manager to e.g. center dialogs. Also, if you set the transient parent of dialogs with gtk-window-set-transient-for window managers will often center the dialog over its parent window. It’s much preferred to let the window manager handle these things rather than doing it yourself, because all apps will behave consistently and according to user prefs if the window manager handles it. Also, the window manager can take the size of the window decorations/border into account, while your application cannot.

In any case, if you insist on application-specified window positioning, there’s still a better way than doing it yourself - gtk-window-set-position will frequently handle the details for you.

window a <gtk-window>
width return location for width, or '#f'
height return location for height, or '#f'

```c
gtk-window-get-title (self <gtk-window>) ⇒ (ret mchars)  [Function]
get-title
Retrieves the title of the window. See gtk-window-set-title.

window a <gtk-window>
ret the title of the window, or '#f' if none has been set explicitly. The returned string is owned by the widget and must not be modified or freed.

gtk-window-get-transient-for (self <gtk-window>) ⇒ (ret <gtk-window>)  [Function]
get-transient-for
Fetches the transient parent for this window. See gtk-window-set-transient-for.

window a <gtk-window>
ret the transient parent for this window, or '#f' if no transient parent has been set.

gtk-window-get-type-hint (self <gtk-window>) ⇒ (ret <gdk-window-type-hint>)  [Function]
get-type-hint
Gets the type hint for this window. See gtk-window-set-type-hint.

window a <gtk-window>
ret the type hint for window.
Chapter 5: GtkWindow

```c
gtk-window-get-skip-taskbar-hint (self <gtk-window>) ⇒ (ret bool)
```

**get-skip-taskbar-hint**

Gets the value set by `gtk-window-set-skip-taskbar-hint`

- `window` : a `<gtk-window>`
- `ret` : `'#t'` if window shouldn’t be in taskbar

Since 2.2

```c
gtk-window-get-skip-pager-hint (self <gtk-window>) ⇒ (ret bool)
```

**get-skip-pager-hint**

Gets the value set by `gtk-window-set-skip-pager-hint`

- `window` : a `<gtk-window>`
- `ret` : `'#t'` if window shouldn’t be in pager

Since 2.2

```c
gtk-window-get-urgency-hint (self <gtk-window>) ⇒ (ret bool)
```

**get-urgency-hint**

Gets the value set by `gtk-window-set-urgency-hint`

- `window` : a `<gtk-window>`
- `ret` : `'#t'` if window is urgent

Since 2.8

```c
gtk-window-get-accept-focus (self <gtk-window>) ⇒ (ret bool)
```

**get-accept-focus**

Gets the value set by `gtk-window-set-accept-focus`

- `window` : a `<gtk-window>`
- `ret` : `'#t'` if window should receive the input focus

Since 2.4

```c
gtk-window-get-focus-on-map (self <gtk-window>) ⇒ (ret bool)
```

**get-focus-on-map**

Gets the value set by `gtk-window-set-focus-on-map`

- `window` : a `<gtk-window>`
- `ret` : `'#t'` if window should receive the input focus when mapped.

Since 2.6

```c
gtk-window-get-group (self <gtk-window>) ⇒ (ret <gtk-window-group>)
```

**get-group**

Returns the group for `window` or the default group, if `window` is `'#f'` or if `window` does not have an explicit window group.
**window**  a `<gtk-window>`, or `'#f'

**ret**  the `<gtk-window-group>` for a window or the default group

Since 2.10

```python
gtk-window-move (self <gtk-window>) (x int) (y int)
```

[Function]

**move**  Asks the window manager to move window to the given position. Window managers are free to ignore this; most window managers ignore requests for initial window positions (instead using a user-defined placement algorithm) and honor requests after the window has already been shown.

Note: the position is the position of the gravity-determined reference point for the window. The gravity determines two things: first, the location of the reference point in root window coordinates; and second, which point on the window is positioned at the reference point.

By default the gravity is `<gdk-gravity-north-west>`, so the reference point is simply the x, y supplied to `gtk-window-move`. The top-left corner of the window decorations (aka window frame or border) will be placed at x, y. Therefore, to position a window at the top left of the screen, you want to use the default gravity (which is `<gdk-gravity-north-west>`) and move the window to 0,0.

To position a window at the bottom right corner of the screen, you would set `<gdk-gravity-south-east>`, which means that the reference point is at x + the window width and y + the window height, and the bottom-right corner of the window border will be placed at that reference point. So, to place a window in the bottom right corner you would first set gravity to south east, then write: `gtk_window_move (window, gdk-screen-width - window_width, gdk-screen-height - window_height)` (note that this example does not take multi-head scenarios into account).

The Extended Window Manager Hints specification at [http://www.freedesktop.org/Standards/wm-spec](http://www.freedesktop.org/Standards/wm-spec) has a nice table of gravities in the "implementation notes" section.

The `gtk-window-get-position` documentation may also be relevant.

```python
gtk-window-get-position (self <gtk-window>)
```

[Method]

**window**  a `<gtk-window>`

**x**  X coordinate to move window to

**y**  Y coordinate to move window to

```python
gtk-window-parse-geometry (self <gtk-window>) (geometry mchars)
```

[Function]

**parse-geometry**  Parses a standard X Window System geometry string - see the manual page for X (type `man X`) for details on this. `gtk-window-parse-geometry` does work on all GTK+ ports including Win32 but is primarily intended for an X environment.

If either a size or a position can be extracted from the geometry string, `gtk-window-parse-geometry` returns `'#t'` and calls `gtk-window-set-default-size` and/or `gtk-window-move` to resize/move the window.
If `gtk-window-parse-geometry` returns `#t`, it will also set the `<gdk-hint-user-pos>` and/or `<gdk-hint-user-size>` hints indicating to the window manager that the size/position of the window was user-specified. This causes most window managers to honor the geometry.

Note that for `gtk-window-parse-geometry` to work as expected, it has to be called when the window has its "final" size, i.e. after calling `gtk-widget-show-all` on the contents and `gtk-window-set-geometry-hints` on the window.

```c
#include <gtk/gtk.h>

static void
fill_with_content (GtkWidget *vbox)
{
    /* fill with content... */
}

int
main (int argc, char *argv[])
{
    GtkWidget *window, *vbox;
    GdkGeometry size_hints = {
        100, 50, 0, 0, 100, 50, 10, 10, 0.0, 0.0, GDK_GRAVITY_NORTH_WEST
    };

    gtk_init (&argc, &argv);

    window = gtk_window_new (GTK_WINDOW_TOPLEVEL);
    vbox = gtk_vbox_new (FALSE, 0);

    gtk_container_add (GTK_CONTAINER (window), vbox);
    fill_with_content (vbox);
    gtk_widget_show_all (vbox);
    gtk_window_set_geometry_hints (GTK_WINDOW (window),
                                   window,
                                   &size_hints,
                                   GDK_HINT_MIN_SIZE |
                                   GDK_HINT_BASE_SIZE |
                                   GDK_HINT_RESIZE_INC);

    if (argc > 1)
    {
        if (!gtk_window_parse_geometry (GTK_WINDOW (window), argv[1]))
            fprintf (stderr, "Failed to parse '%s'\n", argv[1]);
    }
```
Chapter 5: GtWindow

```c
    gtk_widget_show_all (window);
    gtk_main ();

    return 0;
}
```

`window` is a `<gtk-window>`

`geometry` is a geometry string

`ret` is ‘#t’ if string was parsed successfully.

### gtk-window-reshow-with-initial-size

#### [Function]

**reshow-with-initial-size**

Hides `window`, then reshows it, resetting the default size and position of the window.

Used by GUI builders only.

`window` is a `<gtk-window>`

### gtk-window-resize

#### [Function]

**resize**

Resizes the window as if the user had done so, obeying geometry constraints. The default geometry constraint is that windows may not be smaller than their size request; to override this constraint, call `gtk-widget-set-size-request` to set the window’s request to a smaller value.

If `gtk-window-resize` is called before showing a window for the first time, it overrides any default size set with `gtk-window-set-default-size`.

Windows may not be resized smaller than 1 by 1 pixels.

`window` is a `<gtk-window>`

`width` is width in pixels to resize the window to

`height` is height in pixels to resize the window to

### gtk-window-set-default-icon-list

#### [Function]

Sets an icon list to be used as fallback for windows that haven’t had `gtk-window-set-icon-list` called on them to set up a window-specific icon list. This function allows you to set up the icon for all windows in your app at once.

See `gtk-window-set-icon-list` for more details.

`list` is a list of `<gdk-pixbuf>`

### gtk-window-set-default-icon

#### [Function]

Sets an icon to be used as fallback for windows that haven’t had `gtk-window-set-icon` called on them from a pixbuf.

`icon` is the icon

Since 2.4
Chapter 5: GtkWindow

```c
gtk-window-set-default-icon-name (name mchars) [Function]
Sets an icon to be used as fallback for windows that haven’t had
gtk-window-set-icon-list called on them from a named themed icon, see
gtk-window-set-icon-name.

name     the name of the themed icon

Since 2.6
```

```c
gtk-window-set-icon (self <gtk-window>) (icon <gdk-pixbuf>) [Function]
set-icon
Sets up the icon representing a <gtk-window>. This icon is used when the window is
minimized (also known as iconified). Some window managers or desktop environments
may also place it in the window frame, or display it in other contexts.

The icon should be provided in whatever size it was naturally drawn; that is, don’t
scale the image before passing it to GTK+. Scaling is postponed until the last minute,
when the desired final size is known, to allow best quality.

If you have your icon hand-drawn in multiple sizes, use gtk-window-set-icon-list.
Then the best size will be used.

This function is equivalent to calling gtk-window-set-icon-list with a 1-element
list.

See also gtk-window-set-default-icon-list to set the icon for all windows in your
application in one go.

window  a <gtk-window>
icon     icon image, or ‘#f’
```

```c
gtk-window-set-icon-list (self <gtk-window>) (list glist-of) [Function]
set-icon-list
Sets up the icon representing a <gtk-window>. The icon is used when the window is
minimized (also known as iconified). Some window managers or desktop environments
may also place it in the window frame, or display it in other contexts.

gtk-window-set-icon-list allows you to pass in the same icon in several hand-
drawn sizes. The list should contain the natural sizes your icon is available in; that
is, don’t scale the image before passing it to GTK+. Scaling is postponed until the
last minute, when the desired final size is known, to allow best quality.

By passing several sizes, you may improve the final image quality of the icon, by
reducing or eliminating automatic image scaling.

Recommended sizes to provide: 16x16, 32x32, 48x48 at minimum, and larger images
(64x64, 128x128) if you have them.

See also gtk-window-set-default-icon-list to set the icon for all windows in your
application in one go.

Note that transient windows (those who have been set transient for another window
using gtk-window-set_transient_for) will inherit their icon from their transient
parent. So there’s no need to explicitly set the icon on transient windows.

window  a <gtk-window>
list     list of <gdk-pixbuf>
```
gtk-window-set-icon-from-file \( (\text{self} <\text{gtk-window}>) \) \( (\text{filename} \ mchars) \Rightarrow (\text{ret} \ \text{bool}) \)

**set-icon-from-file**

Sets the icon for *window*. Warns on failure if *err* is ‘#f’.

This function is equivalent to calling gtk-window-set-icon with a pixbuf created by loading the image from *filename*.

*window* a \(<\text{gtk-window}>\)

*filename* location of icon file

*err* location to store error, or ‘#f’.

*ret* ‘#t’ if setting the icon succeeded.

Since 2.2

gtk-window-set-icon-name \( (\text{self} <\text{gtk-window}>) (\text{name} \ mchars) \) \[Function\]

**set-icon-name**

Sets the icon for the window from a named themed icon. See the docs for \(<\text{gtk-icon-theme}>\) for more details.

Note that this has nothing to do with the WM_ICON_NAME property which is mentioned in the ICCCM.

*window* a \(<\text{gtk-window}>\)

*name* the name of the themed icon

Since 2.6
6 GtkWindowGroup

Limit the effect of grabs

6.1 Overview

6.2 Usage

<gtk-window-group> [Class]
  Derives from <gobject>.
  This class defines no direct slots.

gtk-window-group-new ⇒ (ret <gtk-window-group>) [Function]
  Creates a new <gtk-window-group> object. Grabs added with gtk-grab-add only affect windows within the same <gtk-window-group>.
  ret a new <gtk-window-group>.

gtk-window-group-add-window (self <gtk-window-group>) (window <gtk-window>) [Function]
  add-window [Method]
  Adds a window to a <gtk-window-group>.
  window-group a <gtk-window-group>
  window the <gtk-window> to add

gtk-window-group-remove-window (self <gtk-window-group>) (window <gtk-window>) [Function]
  remove-window [Method]
  Removes a window from a <gtk-window-group>.
  window-group a <gtk-window-group>
  window the <gtk-window> to remove
7 GtkAboutDialog

Display information about an application

7.1 Overview

The <gtk-about-dialog> offers a simple way to display information about a program like its logo, name, copyright, website and license. It is also possible to give credits to the authors, documenters, translators and artists who have worked on the program. An about dialog is typically opened when the user selects the ‘About’ option from the ‘Help’ menu. All parts of the dialog are optional.

About dialog often contain links and email addresses. <gtk-about-dialog> supports this by offering global hooks, which are called when the user clicks on a link or email address, see gtk-about-dialog-set-email-hook and gtk-about-dialog-set-url-hook. Email addresses in the authors, documenters and artists properties are recognized by looking for ‘<user@host>’, URLs are recognized by looking for ‘http://url’, with ‘url’ extending to the next space, tab or line break.

To make constructing a <gtk-about-dialog> as convenient as possible, you can use the function gtk-show-about-dialog which constructs and shows a dialog and keeps it around so that it can be shown again.

7.2 Usage

<gtk-about-dialog>  
Derives from <gtk-dialog>.  
This class defines the following slots:

- **program-name**  
  The name of the program. If this is not set, it defaults to g_get_application_name()

- **version**  
  The version of the program

- **copyright**  
  Copyright information for the program

- **comments**  
  Comments about the program

- **website**  
  The URL for the link to the website of the program

- **website-label**  
  The label for the link to the website of the program. If this is not set, it defaults to the URL

- **license**  
  The license of the program

- **authors**  
  List of authors of the program

- **documenters**  
  List of people documenting the program

- **translator-credits**  
  Credits to the translators. This string should be marked as translatable
artists List of people who have contributed artwork to the program

logo A logo for the about box. If this is not set, it defaults to `gtk_window.get_default_icon_list()`

logo-icon-name A named icon to use as the logo for the about box.

wrap-license Whether to wrap the license text.

```c
gtk-about-dialog-new ⇒ (ret <gtk-widget>)
```
Creates a new `<gtk-about-dialog>`.

```c
ret
da newly created <gtk-about-dialog>
```
Since 2.6

```c
gtk-about-dialog-get-name (self <gtk-about-dialog>) ⇒ (ret mchars)
```
Returns the program name displayed in the about dialog.

```c
about
a <gtk-about-dialog>
ret
The program name. The string is owned by the about dialog and must not be modified.
```
Since 2.6

```c
gtk-about-dialog-set-name (self <gtk-about-dialog>)
(name mchars)
```
Sets the name to display in the about dialog. If this is not set, it defaults to `g-get-application-name`.

```c
about
a <gtk-about-dialog>
name
the program name
```
Since 2.6

```c
gtk-about-dialog-get-version (self <gtk-about-dialog>) ⇒ (ret mchars)
```
Returns the version string.

```c
about
a <gtk-about-dialog>
ret
The version string. The string is owned by the about dialog and must not be modified.
```
Since 2.6
gtk-about-dialog-set-version (self <gtk-about-dialog>)

(version mchars)

set-version

Sets the version string to display in the about dialog.

about a <gtk-about-dialog>

version the version string

Since 2.6

gtk-about-dialog-get-copyright (self <gtk-about-dialog>)

⇒ (ret mchars)

get-copyright

Returns the copyright string.

about a <gtk-about-dialog>

ret The copyright string. The string is owned by the about dialog and must
not be modified.

Since 2.6

gtk-about-dialog-set-copyright (self <gtk-about-dialog>)

(set copyright mchars)

set-copyright

Sets the copyright string to display in the about dialog. This should be a short string
of one or two lines.

about a <gtk-about-dialog>

copyright the copyright string

Since 2.6

gtk-about-dialog-get-license (self <gtk-about-dialog>)

⇒ (ret mchars)

get-license

Returns the license information.

about a <gtk-about-dialog>

ret The license information. The string is owned by the about dialog and
must not be modified.

Since 2.6

gtk-about-dialog-set-license (self <gtk-about-dialog>)

(license mchars)

set-license

Sets the license information to be displayed in the secondary license dialog. If license
is ‘#f’, the license button is hidden.

about a <gtk-about-dialog>

license the license information or ‘#f’

Since 2.6
**gtk-about-dialog-get-wrap-license** *(self <gtk-about-dialog>)*  
⇒ *(ret bool)*  

**get-wrap-license**  
Returns whether the license text in *about* is automatically wrapped.  

*about* a <gtk-about-dialog>  
*ret* ‘#t’ if the license text is wrapped  

Since 2.8

**gtk-about-dialog-set-wrap-license** *(self <gtk-about-dialog>)*  
*(wrap-license bool)*  

**set-wrap-license**  
Sets whether the license text in *about* is automatically wrapped.  

*about* a <gtk-about-dialog>  
*wrap-license* whether to wrap the license  

Since 2.8

**gtk-about-dialog-get-website** *(self <gtk-about-dialog>)*  
⇒ *(ret mchars)*  

**get-website**  
Returns the website URL.  

*about* a <gtk-about-dialog>  
*ret* The website URL. The string is owned by the about dialog and must not be modified.  

Since 2.6

**gtk-about-dialog-set-website** *(self <gtk-about-dialog>)*  
*(website mchars)*  

**set-website**  
Sets the URL to use for the website link.  

*about* a <gtk-about-dialog>  
*website* a URL string starting with "http://"  

Since 2.6

**gtk-about-dialog-get-website-label** *(self <gtk-about-dialog>)*  
⇒ *(ret mchars)*  

**get-website-label**  
Returns the label used for the website link.  

*about* a <gtk-about-dialog>  
*ret* The label used for the website link. The string is owned by the about dialog and must not be modified.  

Since 2.6
Chapter 7: GtkAboutDialog

```c
gtk-about-dialog-set-website-label (self <gtk-about-dialog>)
    (website_label mchars)
set-website-label
    Sets the label to be used for the website link. It defaults to the website URL.
    about a <gtk-about-dialog>
    website-label
        the label used for the website link
Since 2.6
```

```c
gtk-about-dialog-get-logo (self <gtk-about-dialog>)
    ⇒ (ret <gdk-pixbuf>)
get-logo
    Returns the pixbuf displayed as logo in the about dialog.
    about a <gtk-about-dialog>
    ret
        the pixbuf displayed as logo. The pixbuf is owned by the about dialog. If you want to keep a reference to it, you have to call `g-object-ref` on it.
Since 2.6
```

```c
gtk-about-dialog-set-logo (self <gtk-about-dialog>)
    (logo <gdk-pixbuf>)
set-logo
    Sets the pixbuf to be displayed as logo in the about dialog. If it is `'#f'`, the default window icon set with `gtk-window-set-default-icon` will be used.
    about a <gtk-about-dialog>
    logo a <gdk-pixbuf>, or `'#f'
Since 2.6
```

```c
gtk-about-dialog-get-logo-icon-name (self <gtk-about-dialog>)
    ⇒ (ret mchars)
get-logo-icon-name
    Returns the icon name displayed as logo in the about dialog.
    about a <gtk-about-dialog>
    ret
        the icon name displayed as logo. The string is owned by the dialog. If you want to keep a reference to it, you have to call `g-strdup` on it.
Since 2.6
```

```c
gtk-about-dialog-set-logo-icon-name (self <gtk-about-dialog>)
    (icon_name mchars)
set-logo-icon-name
    Sets the pixbuf to be displayed as logo in the about dialog. If it is `'#f'`, the default window icon set with `gtk-window-set-default-icon` will be used.
    about a <gtk-about-dialog>
    icon-name an icon name, or `'#f'
Since 2.6
```
8 GtkAssistant

A widget used to guide users through multi-step operations

8.1 Overview

A `<gtk-assistant>` is a widget used to represent a generally complex operation splitted in several steps, guiding the user through its pages and controlling the page flow to collect the necessary data.

8.2 Usage

`<gtk-assistant>` [Class]

Derives from `<gtk-window>`. This class defines no direct slots.

`close` [Signal on `<gtk-assistant>`]

The `:close` signal is emitted either when the close button of a summary page is clicked, or when the apply button in the last page in the flow (of type GTK_ASSISTANT_PAGE_CONFIRM) is clicked.

Since 2.10

`cancel` [Signal on `<gtk-assistant>`]

The `:cancel` signal is emitted when then the cancel button is clicked.

Since 2.10

`prepare (arg0 `<gtk-widget>`)` [Signal on `<gtk-assistant>`]

The `:prepared` signal is emitted when a new page is set as the assistant’s current page, before making the new page visible. A handler for this signal can do any preparation which are necessary before showing page.

Since 2.10

`apply` [Signal on `<gtk-assistant>`]

The `:apply` signal is emitted when the apply button is clicked. The default behavior of the `<gtk-assistant>` is to switch to the page after the current page, unless the current page is the last one.

A handler for the `:apply` signal should carry out the actions for which the wizard has collected data. If the action takes a long time to complete, you might consider to put a page of type GTK_ASSISTANT_PAGE_PROGRESS after the confirmation page and handle this operation within the `:prepare` signal of the progress page.

Since 2.10

`gtk-assistant-new ⇒ (ret `<gtk-widget>`)` [Function]

Creates a new `<gtk-assistant>`.

`ret` a newly created `<gtk-assistant>`

Since 2.10
Chapter 8: GtkAssistant

### gtk-assistant-get-current-page

#### Function

```c
(gtk-assistant> self) ⇒ (ret int)
```

#### Method

Returns the page number of the current page

- **assistant**: a `<gtk-assistant>`
- **ret**: The index (starting from 0) of the current page in the `assistant`, if the `assistant` has no pages, -1 will be returned.

Since 2.10

### gtk-assistant-set-current-page

#### Function

```c
(self <gtk-assistant>) ➞ (page_num int)
```

#### Method

Switches the page to `page_num`. Note that this will only be necessary in custom buttons, as the `assistant` flow can be set with `gtk-assistant-set-forward-page-func`.

- **assistant**: a `<gtk-assistant>`
- **page_num**: index of the page to switch to, starting from 0. If negative, the last page will be used. If greater than the number of pages in the `assistant`, nothing will be done.

Since 2.10

### gtk-assistant-get-n-pages

#### Function

```c
(self <gtk-assistant>) ⇒ (ret int)
```

#### Method

Returns the number of pages in the `assistant`

- **assistant**: a `<gtk-assistant>`
- **ret**: The number of pages in the `assistant`.

Since 2.10

### gtk-assistant-get-nth-page

#### Function

```c
(self <gtk-assistant>) ➞ (page_num int) ⇒ (ret <gtk-widget>)
```

#### Method

Returns the child widget contained in page number `page_num`.

- **assistant**: a `<gtk-assistant>`
- **page_num**: The index of a page in the `assistant`, or -1 to get the last page;
- **ret**: The child widget, or `#f` if `page_num` is out of bounds.

Since 2.10

### gtk-assistant-prepend-page

#### Function

```c
(self <gtk-assistant>) ➞ (page <gtk-widget>) ⇒ (ret int)
```

#### Method

Prepends a page to the `assistant`.

- **assistant**: a `<gtk-assistant>`
page a `<gtk-widget>`
ret the index (starting at 0) of the inserted page

Since 2.10

`gtk-assistant-append-page (self <gtk-assistant>)` [Function]
```
(page <gtk-widget>) ⇒ (ret int)
```
append-page [Method]
Appends a page to the assistant.

assistant a `<gtk-assistant>`
page a `<gtk-widget>`
ret the index (starting at 0) of the inserted page

Since 2.10

`gtk-assistant-insert-page (self <gtk-assistant>)` [Function]
```
(page <gtk-widget>) (position int) ⇒ (ret int)
```
insert-page [Method]
Inserts a page in the assistant at a given position.

assistant a `<gtk-assistant>`
page a `<gtk-widget>`
position the index (starting at 0) at which to insert the page, or -1 to append the page to the assistant
ret the index (starting from 0) of the inserted page

Since 2.10

`gtk-assistant-set-page-type (self <gtk-assistant>)` [Function]
```
(page <gtk-widget>) (type <gtk-assistant-page-type>)
```
set-page-type [Method]
Sets the page type for page. The page type determines the page behavior in the assistant.

assistant a `<gtk-assistant>`
page a page of assistant
type the new type for page

Since 2.10

`gtk-assistant-get-page-type (self <gtk-assistant>)` [Function]
```
(page <gtk-widget>) ⇒ (ret <gtk-assistant-page-type>)
```
get-page-type [Method]
Gets the page type of page.

assistant a `<gtk-assistant>`
page a page of assistant
ret the page type of page.

Since 2.10
Chapter 8: GtkAssistant

**gtk-Assistant-set-page-title**

```python
(gtk-assistant-set-page-title (self <gtk-assistant>)
  (page <gtk-widget>) (title mchars))
```

**set-page-title**

Sets a title for page. The title is displayed in the header area of the assistant when page is the current page.

- **assistant**: a <gtk-assistant>
- **page**: a page of assistant
- **title**: the new title for page

Since 2.10

**gtk-Assistant-get-page-title**

```python
(gtk-assistant-get-page-title (self <gtk-assistant>)
  (page <gtk-widget>) ⇒ (ret mchars))
```

**get-page-title**

Gets the title for page.

- **assistant**: a <gtk-assistant>
- **page**: a page of assistant
- **ret**: the title for page.

Since 2.10

**gtk-Assistant-set-page-header-image**

```python
(gtk-assistant-set-page-header-image (self <gtk-assistant>)
  (page <gtk-widget>) (pixbuf <gdk-pixbuf>)
```

**set-page-header-image**

Sets a header image for page. This image is displayed in the header area of the assistant when page is the current page.

- **assistant**: a <gtk-assistant>
- **page**: a page of assistant
- **pixbuf**: the new header image

Since 2.10

**gtk-Assistant-get-page-header-image**

```python
(gtk-assistant-get-page-header-image (self <gtk-assistant>)
  (page <gtk-widget>) ⇒ (ret <gdk-pixbuf>)
```

**get-page-header-image**

Gets the header image for page.

- **assistant**: a <gtk-assistant>
- **page**: a page of assistant
- **ret**: the header image for page, or ‘#f’ if there’s no header image for the page.

Since 2.10

**gtk-Assistant-set-page-side-image**

```python
(gtk-assistant-set-page-side-image (self <gtk-assistant>)
  (page <gtk-widget>) (pixbuf <gdk-pixbuf>)
```

**set-page-side-image**

Sets a header image for page. This image is displayed in the side area of the assistant when page is the current page.
Since 2.10

gtk-assistant-get-page-side-image (self <gtk-assistant>) (page <gtk-widget>) ⇒ (ret <gdk-pixbuf>)
get-page-side-image
Gets the header image for page.

Since 2.10

gtk-assistant-set-page-complete (self <gtk-assistant>) (page <gtk-widget>) (complete bool)
set-page-complete
Sets whether page contents are complete. This will make assistant update the buttons state to be able to continue the task.

Since 2.10

gtk-assistant-get-page-complete (self <gtk-assistant>) (page <gtk-widget>) ⇒ (ret bool)
get-page-complete
Gets whether page is complete.

Since 2.10

gtk-assistant-add-action-widget (self <gtk-assistant>) (child <gtk-widget>)
add-action-widget
Add a widget to the action area of a <gtk-assistant>.
remove-action-widget

Removes a widget from the action area of a <gtk-assistant>.

Assistant a <gtk-assistant>

Child a <gtk-widget>

Since 2.10

update-buttons-state

Forces assistant to recomputed the buttons state.

GTK+ automatically takes care of this in most situations, e.g. when the user goes to a different page, or when the visibility or completeness of a page changes.

One situation where it can be necessary to call this function is when changing a value on the current page affects the future page flow of the assistant.

Assistant a <gtk-assistant>

Since 2.10
A label which displays an accelerator key on the right of the text

9.1 Overview

The `<gtk-accel-label>` widget is a subclass of `<gtk-label>` that also displays an accelerator key on the right of the label text, e.g. 'Ctrl+S'. It is commonly used in menus to show the keyboard short-cuts for commands.

The accelerator key to display is not set explicitly. Instead, the `<gtk-accel-label>` displays the accelerators which have been added to a particular widget. This widget is set by calling `gtk-accel-label-set-accel-widget`.

For example, a `<gtk-menu-item>` widget may have an accelerator added to emit the "activate" signal when the 'Ctrl+S' key combination is pressed. A `<gtk-accel-label>` is created and added to the `<gtk-menu-item>`, and `gtk-accel-label-set-accel-widget` is called with the `<gtk-menu-item>` as the second argument. The `<gtk-accel-label>` will now display 'Ctrl+S' after its label.

Note that creating a `<gtk-menu-item>` with `gtk-menu-item-new-with-label` (or one of the similar functions for `<gtk-check-menu-item>` and `<gtk-radio-menu-item>`) automatically adds a `<gtk-accel-label>` to the `<gtk-menu-item>` and calls `gtk-accel-label-set-accel-widget` to set it up for you.

A `<gtk-accel-label>` will only display accelerators which have 'GTK_ACCEL_VISIBLE' set (see `<gtk-accel-flags>`). A `<gtk-accel-label>` can display multiple accelerators and even signal names, though it is almost always used to display just one accelerator key.

```c
GtkWidget *save_item;
GtkAccelGroup *accel_group;

/* Create a GtkAccelGroup and add it to the window. */
accel_group = gtk_accel_group_new ();
gtk_window_add_accel_group (GTK_WINDOW (window), accel_group);

/* Create the menu item using the convenience function. */
save_item = gtk_menu_item_new_with_label ("Save");
gtk_widget_show (save_item);
gtk_container_add (GTK_CONTAINER (menu), save_item);

/* Now add the accelerator to the GtkMenuItem. Note that since we called
   gtk_menu_item_new_with_label() to create the GtkMenuItem the
   GtkAccelLabel is automatically set up to display the GtkMenuItem
   accelerators. We just need to make sure we use GTK_ACCEL_VISIBLE here. */
gtk_widget_add_accelerator (save_item, "activate", accel_group,
                           GDK_s, GDK_CONTROL_MASK, GTK_ACCEL_VISIBLE);
```
9.2 Usage

<gtk-accel-label> [Class]
Derives from <gtk-label>.
This class defines the following slots:

accel-closure
The closure to be monitored for accelerator changes

accel-widget
The widget to be monitored for accelerator changes

gtk-accel-label-new (string mchars) ⇒ (ret <gtk-widget>) [Function]
Creates a new <gtk-accel-label>.

string the label string. Must be non-‘#f’.

ret a new <gtk-accel-label>.

gtk-accel-label-set-accel-closure (self <gtk-accel-label>)
(accel_closure <gclosure>) [Method]
Sets the closure to be monitored by this accelerator label. The closure must be
connected to an accelerator group; see gtk-accel-group-connect.

accel-label a <gtk-accel-label>
accel-closure
the closure to monitor for accelerator changes.

gtk-accel-label-get-accel-widget (self <gtk-accel-label>)
⇒ (ret <gtk-widget>) [Function]
get-accel-widget [Method]
Fetches the widget monitored by this accelerator label. See gtk-accel-label-set-
accel-widget.

accel-label a <gtk-accel-label>
ret the object monitored by the accelerator label, or ‘#f’.

gtk-accel-label-set-accel-widget (self <gtk-accel-label>)
(accel_widget <gtk-widget>) [Function]
set-accel-widget [Method]
Sets the widget to be monitored by this accelerator label.

accel-label a <gtk-accel-label>
accel-widget
the widget to be monitored.

gtk-accel-label-get-accel-width (self <gtk-accel-label>)
⇒ (ret unsigned-int) [Function]
get-accel-width [Method]
Returns the width needed to display the accelerator key(s). This is used by menus to
align all of the <gtk-menu-item> widgets, and shouldn’t be needed by applications.
accel-label  a `<gtk-accel-label>`.

ret  the width needed to display the accelerator key(s).

```plaintext
gtk-accel-label-refetch (self <gtk-accel-label>) ⇒ (ret bool)  [Function]
```

refetch  [Method]
Recreates the string representing the accelerator keys. This should not be needed since the string is automatically updated whenever accelerators are added or removed from the associated widget.

accel-label  a `<gtk-accel-label>`.

ret  always returns ‘#f’.
10 GtkImage

A widget displaying an image

10.1 Overview

The <gtk-image> widget displays an image. Various kinds of object can be displayed as an image; most typically, you would load a <gdk-pixbuf> ("pixel buffer") from a file, and then display that. There's a convenience function to do this, gtk-image-new-from-file, used as follows: If the file isn't loaded successfully, the image will contain a "broken image" icon similar to that used in many web browsers. If you want to handle errors in loading the file yourself, for example by displaying an error message, then load the image with gdk-pixbuf-new-from-file, then create the <gtk-image> with gtk-image-new-from-pixbuf.

```c
GtkWidget *image;
image = gtk_image_new_from_file ("myfile.png");
```

The image file may contain an animation, if so the <gtk-image> will display an animation (<gdk-pixbuf-animation>) instead of a static image.

<gtk-image> is a subclass of <gtk-misc>, which implies that you can align it (center, left, right) and add padding to it, using <gtk-misc> methods.

<gtk-image> is a "no window" widget (has no <gdk-window> of its own), so by default does not receive events. If you want to receive events on the image, such as button clicks, place the image inside a <gtk-event-box>, then connect to the event signals on the event box.

```c
static gboolean
button_press_callback (GtkWidget *event_box,
                      GdkEventButton *event,
                      gpointer data)
{
    g_print ("Event box clicked at coordinates %f,%f\n",
             event->x, event->y);

    /* Returning TRUE means we handled the event, so the signal
       * emission should be stopped (don't call any further
       * callbacks that may be connected). Return FALSE
       * to continue invoking callbacks.
       */
    return TRUE;
}

static GtkWidget*
create_image (void)
{
    GtkWidget *image;
    GtkWidget *event_box;
```
image = gtk_image_new_from_file("myfile.png");

event_box = gtk_event_box_new();

gtk_container_add(GTK_CONTAINER(event_box), image);

g_signal_connect(G_OBJECT(event_box),
    "button_press_event",
    G_CALLBACK(button_press_callback),
    image);

return image;
}

When handling events on the event box, keep in mind that coordinates in the image may be different from event box coordinates due to the alignment and padding settings on the image (see <gtk-misc>). The simplest way to solve this is to set the alignment to 0.0 (left/top), and set the padding to zero. Then the origin of the image will be the same as the origin of the event box.

Sometimes an application will want to avoid depending on external data files, such as image files. GTK+ comes with a program to avoid this, called . This program allows you to convert an image into a C variable declaration, which can then be loaded into a <gdk-pixbuf> using gdk-pixbuf-new-from-inline.

10.2 Usage

<gtk-image> [Class]

Derives from <gtk-misc>.

This class defines the following slots:
pixbuf A GdkPixbuf to display
Pixmap A GdkPixmap to display
image A GdkImage to display
mask Mask bitmap to use with GdkImage or GdkPixmap
file Filename to load and display
stock Stock ID for a stock image to display
icon-set Icon ID to display
icon-size Symbolic size to use for stock icon, icon set or named icon
pixel-size Pixel size to use for named icon
pixbuf-animation GdkPixbufAnimation to display
icon-name
The name of the icon from the icon theme

storage-type
The representation being used for image data

gtk-image-get-pixbuf (self <gtk-image>) ⇒ (ret <gdk-pixbuf>) [Function]
get-pixbuf
Gets the <gdk-pixbuf> being displayed by the <gtk-image>. The storage type of the image must be 'GTK_IMAGE_EMPTY' or 'GTK_IMAGE_PIXBUF' (see gtk-image-get-storage-type). The caller of this function does not own a reference to the returned pixbuf.

image a <gtk-image>
ret the displayed pixbuf, or '#f' if the image is empty

gtk-image-get-animation (self <gtk-image>) [Function]
⇒ (ret <gdk-pixbuf-animation>)
get-animation
Gets the <gdk-pixbuf-animation> being displayed by the <gtk-image>. The storage type of the image must be 'GTK_IMAGE_EMPTY' or 'GTK_IMAGE_ANIMATION' (see gtk-image-get-storage-type). The caller of this function does not own a reference to the returned animation.

image a <gtk-image>
ret the displayed animation, or '#f' if the image is empty

gtk-image-get-storage-type (self <gtk-image>) [Function]
⇒ (ret <gtk-image-type>)
get-storage-type
Gets the type of representation being used by the <gtk-image> to store image data. If the <gtk-image> has no image data, the return value will be 'GTK_IMAGE_EMPTY'.

image a <gtk-image>
ret image representation being used

gtk-image-new-from-file (filename mchars) ⇒ (ret <gtk-widget>) [Function]
Creates a new <gtk-image> displaying the file filename. If the file isn't found or can't be loaded, the resulting <gtk-image> will display a "broken image" icon. This function never returns '#f', it always returns a valid <gtk-image> widget.

If the file contains an animation, the image will contain an animation.

If you need to detect failures to load the file, use gdk-pixbuf-new-from-file to load the file yourself, then create the <gtk-image> from the pixbuf. (Or for animations, use gdk-pixbuf-animation-new-from-file).

The storage type (gtk-image-get-storage-type) of the returned image is not defined, it will be whatever is appropriate for displaying the file.

filename a filename
ret a new <gtk-image>
Chapter 10: GtkImage

**gtk-image-new-from-icon-set (icon_set <gtk-icon-set>)**

(Function)

(size <gtk-icon-size>) ⇒ (ret <gtk-widget>)

Creates a <gtk-image> displaying an icon set. Sample stock sizes are <gtk-icon-size-menu>, <gtk-icon-size-small-toolbar>. Instead of using this function, usually it’s better to create a <gtk-icon-factory>, put your icon sets in the icon factory, add the icon factory to the list of default factories with gtk-icon-factory-add-default, and then use gtk-image-new-from-stock. This will allow themes to override the icon you ship with your application.

The <gtk-image> does not assume a reference to the icon set; you still need to unref it if you own references. <gtk-image> will add its own reference rather than adopting yours.

icon-set a <gtk-icon-set>

size a stock icon size

ret a new <gtk-image>

**gtk-image-new-from-image (image <gdk-image>)**

(Function)

(mask <gdk-drawable>) ⇒ (ret <gtk-widget>)

Creates a <gtk-image> widget displaying a image with a mask. A <gdk-image> is a client-side image buffer in the pixel format of the current display. The <gtk-image> does not assume a reference to the image or mask; you still need to unref them if you own references. <gtk-image> will add its own reference rather than adopting yours.

image a <gdk-image>, or ‘#f’

mask a <gdk-bitmap>, or ‘#f’

ret a new <gtk-image>

**gtk-image-new-from-pixbuf (pixbuf <gdk-pixbuf>)**

(Function)

⇒ (ret <gtk-widget>)

Creates a new <gtk-image> displaying pixbuf. The <gtk-image> does not assume a reference to the pixbuf; you still need to unref it if you own references. <gtk-image> will add its own reference rather than adopting yours.

Note that this function just creates an <gtk-image> from the pixbuf. The <gtk-image> created will not react to state changes. Should you want that, you should use gtk-image-new-from-icon-set.

pixbuf a <gdk-pixbuf>, or ‘#f’

ret a new <gtk-image>

**gtk-image-new-from-pixmap (pixmap <gdk-pixmap>)**

(Function)

(mask <gdk-drawable>) ⇒ (ret <gtk-widget>)

Creates a <gtk-image> widget displaying pixmap with a mask. A <gdk-pixmap> is a server-side image buffer in the pixel format of the current display. The <gtk-image> does not assume a reference to the pixmap or mask; you still need to unref them if you own references. <gtk-image> will add its own reference rather than adopting yours.

pixmap a <gdk-pixmap>, or ‘#f’
mask a `<gdk-bitmap>`, or ‘#f’
ret a new `<gtk-image>`

```c
gtk-image-new-from-stock (stock_id mchars)
  (size <gtk-icon-size>) ⇒ (ret <gtk-widget>)
```

Creates a `<gtk-image>` displaying a stock icon. Sample stock icon names are `<gtk-stock-open>`, `<gtk-stock-quit>`. Sample stock sizes are `<gtk-icon-size-menu>`, `<gtk-icon-size-small-toolbar>`. If the stock icon name isn’t known, the image will be empty. You can register your own stock icon names, see `gtk-icon-factory-add-default` and `gtk-icon-factory-add`.

stock-id a stock icon name
size a stock icon size
ret a new `<gtk-image>` displaying the stock icon

```c
gtk-image-new-from-animation (animation <gdk-pixbuf-animation>) ⇒ (ret <gtk-widget>)
```

Creates a `<gtk-image>` displaying the given animation. The `<gtk-image>` does not assume a reference to the animation; you still need to_unref it if you own references. `<gtk-image>` will add its own reference rather than adopting yours.

Note that the animation frames are shown using a timeout with `<g-priority-default>`. When using animations to indicate busyness, keep in mind that the animation will only be shown if the main loop is not busy with something that has a higher priority.

animation an animation
ret a new `<gtk-image>` widget

```c
gtk-image-new-from-icon-name (icon_name mchars)
  (size <gtk-icon-size>) ⇒ (ret <gtk-widget>)
```

Creates a `<gtk-image>` displaying an icon from the current icon theme. If the icon name isn’t known, a "broken image" icon will be displayed instead. If the current icon theme is changed, the icon will be updated appropriately.

icon-name an icon name
size a stock icon size
ret a new `<gtk-image>` displaying the themed icon

Since 2.6

```c
gtk-image-set-from-file (self <gtk-image>) (filename mchars)
```

See `gtk-image-new-from-file` for details.

image a `<gtk-image>`
filename a filename or ‘#f’
gtk-image-set-from-icon-set (self <gtk-image>) (icon-set <gtk-icon-set>) (size <gtk-icon-size>)

set-from-icon-set

See gtk-image-new-from-icon-set for details.

image a <gtk-image>
icon-set a <gtk-icon-set>
size a stock icon size

gtk-image-set-from-image (self <gtk-image>) (gdk_image <gdk-image>) (mask <gdk-drawable>)

set-from-image

See gtk-image-new-from-image for details.

image a <gtk-image>
gdk-image a <gdk-image> or ‘#f’
mask a <gdk-bitmap> or ‘#f’

gtk-image-set-from-pixbuf (self <gtk-image>) (pixbuf <gdk-pixbuf>)

set-from-pixbuf

See gtk-image-new-from-pixbuf for details.

image a <gtk-image>
pixbuf a <gdk-pixbuf> or ‘#f’

gtk-image-set-from-pixmap (self <gtk-image>) (pixmap <gdk-pixmap>) (mask <gdk-drawable>)

set-from-pixmap

See gtk-image-new-from-pixmap for details.

image a <gtk-image>
pixmap a <gdk-pixmap> or ‘#f’
mask a <gdk-bitmap> or ‘#f’

gtk-image-set-from-stock (self <gtk-image>) (stock_id mchars) (size <gtk-icon-size>)

set-from-stock

See gtk-image-new-from-stock for details.

image a <gtk-image>
stock-id a stock icon name
size a stock icon size

gtk-image-set-from-animation (self <gtk-image>) (animation <gdk-pixbuf-animation>)

set-from-animation

Causes the <gtk-image> to display the given animation (or display nothing, if you set the animation to ‘#f’).
Chapter 10: GtkImage

image a <gtk-image>

animation the <gdk-pixbuf-animation>

gtk-image-set-from-icon-name (self <gtk-image>)
  (icon_name mchars) (size <gtk-icon-size>)
set-from-icon-name [Method]
  See gtk-image-new-from-icon-name for details.
image a <gtk-image>
icon-name an icon name
size an icon size

Since 2.6

gtk-image-clear (self <gtk-image>)
clear [Method]
  Resets the image to be empty.
image a <gtk-image>

Since 2.8

gtk-image-new ⇒ (ret <gtk-widget>)
  Creates a new empty <gtk-image> widget.
  ret a newly created <gtk-image> widget.
gtk-image-set-pixel-size (self <gtk-image>) (pixel_size int)
set-pixel-size [Method]
  Sets the pixel size to use for named icons. If the pixel size is set to a value != -1, it
  is used instead of the icon size set by gtk-image-set-from-icon-name.
image a <gtk-image>
pixel-size the new pixel size

Since 2.6

gtk-image-get-pixel-size (self <gtk-image>) ⇒ (ret int)
get-pixel-size [Method]
  Gets the pixel size used for named icons.
image a <gtk-image>
ret the pixel size used for named icons.

Since 2.6
11 GtkLabel

A widget that displays a small to medium amount of text

11.1 Overview

The `<gtk-label>` widget displays a small amount of text. As the name implies, most
labels are used to label another widget such as a `<gtk-button>`, a `<gtk-menu-item>`, or a
<gtk-option-menu>.

11.2 Mnemonics

Labels may contain mnemonics. Mnemonics are underlined characters in the label, used
for keyboard navigation. Mnemonics are created by providing a string with an underscore
before the mnemonic character, such as ‘"_File"’, to the functions gtk-label-new-with-
mnemonic or gtk-label-set-text-with-mnemonic.

Mnemonics automatically activate any activatable widget the label is inside, such as a
<gtk-button>; if the label is not inside the mnemonic’s target widget, you have to tell the
label about the target using gtk-label-set-mnemonic-widget. Here’s a simple example
where the label is inside a button: There’s a convenience function to create buttons with
a mnemonic label already inside: To create a mnemonic for a widget alongside the label,
such as a `<gtk-entry>`, you have to point the label at the entry with gtk-label-set-
mnemonic-widget:

```c
/* Pressing Alt+H will activate this button */
button = gtk_button_new ()
label = gtk_label_new_with_mnemonic ("_Hello");
gtk_container_add (GTK_CONTAINER (button), label);

/* Pressing Alt+H will activate this button */
button = gtk_button_new_with_mnemonic ("_Hello");

/* Pressing Alt+H will focus the entry */
entry = gtk_entry_new ()
label = gtk_label_new_with_mnemonic ("_Hello");
gtk_label_set_mnemonic_widget (GTK_LABEL (label), entry);
```

11.3 Markup (styled text)

To make it easy to format text in a label (changing colors, fonts, etc.), label text can be
provided in a simple markup format. Here’s how to create a label with a small font: (See
complete documentation of available tags in the Pango manual.)

```c
label = gtk_label_new (NULL);
gtk_label_set_markup (GTK_LABEL (label), "<small>Small text</small>");
```

The markup passed to gtk-label-set-markup must be valid; for example, literal </>/&
characters must be escaped as &lt;, &gt;, and &amp;. If you pass text obtained from the
user, file, or a network to `gtk-label-set-markup`, you’ll want to escape it with `g-markup-escape-text` or `g-markup-printf-escaped`.

Markup strings are just a convenient way to set the `<pango-attr-list>` on a label; `gtk-label-set-attributes` may be a simpler way to set attributes in some cases. Be careful though; `<pango-attr-list>` tends to cause internationalization problems, unless you’re applying attributes to the entire string (i.e. unless you set the range of each attribute to \([0, \text{G_MAXINT})\)). The reason is that specifying the start_index and end_index for a `<pango-attribute>` requires knowledge of the exact string being displayed, so translations will cause problems.

### 11.4 Selectable labels

Labels can be made selectable with `gtk-label-set-selectable`. Selectable labels allow the user to copy the label contents to the clipboard. Only labels that contain useful-to-copy information &amp;#x2014; such as error messages &amp;#x2014; should be made selectable.

### 11.5 Text layout

A label can contain any number of paragraphs, but will have performance problems if it contains more than a small number. Paragraphs are separated by newlines or other paragraph separators understood by Pango.

Labels can automatically wrap text if you call `gtk-label-set-line-wrap`. `gtk-label-set-justify` sets how the lines in a label align with one another. If you want to set how the label as a whole aligns in its available space, see `gtk-misc-set-alignment`.

### 11.6 Usage

<gtk-label>  
Derives from `<gtk-misc>`.  
This class defines the following slots:  
  * label The text of the label  
  * attributes A list of style attributes to apply to the text of the label  
  * use-markup The text of the label includes XML markup. See pango.parse.markup()  
  * use-underline If set, an underline in the text indicates the next character should be used for the mnemonic accelerator key  
  * justify The alignment of the lines in the text of the label relative to each other. This does NOT affect the alignment of the label within its allocation. See GtkMisc::xalign for that  
  * pattern A string with _ characters in positions correspond to characters in the text to underline  
  * wrap If set, wrap lines if the text becomes too wide
**wrap-mode**
If wrap is set, controls how linewrapping is done

**selectable**
Whether the label text can be selected with the mouse

**mnemonic-keyval**
The mnemonic accelerator key for this label

**mnemonic-widget**
The widget to be activated when the label’s mnemonic key is pressed

**cursor-position**
The current position of the insertion cursor in chars

**selection-bound**
The position of the opposite end of the selection from the cursor in chars

**ellipsize**
The preferred place to ellipsize the string, if the label does not have enough room to display the entire string

**width-chars**
The desired width of the label, in characters

**single-line-mode**
Whether the label is in single line mode

**angle**
Angle at which the label is rotated

**max-width-chars**
The desired maximum width of the label, in characters

**move-cursor** *(arg0 <gtk-movement-step>)* *(arg1 <gint>)* *(arg2 <gboolean>)*
[Signal on <gtk-label>]  

**copy-clipboard**
[Signal on <gtk-label>]

**populate-popup** *(arg0 <gtk-menu>)*
[Signal on <gtk-label>]

**gtk-label-new** *(str mchars)* ⇒ *(ret <gtk-widget>)*
[Function]
Creates a new label with the given text inside it. You can pass ‘#f’ to get an empty label widget.

*str* The text of the label

*ret* the new <gtk-label>

**gtk-label-set-text** *(self <gtk-label>)(str mchars)*
[Function]

**set-text**
Sets the text within the <gtk-label> widget. It overwrites any text that was there before.

This will also clear any previously set mnemonic accelerators.

*label* a <gtk-label>

*str* The text you want to set.
Chapter 11: GtKLabel

```c
gtk-label-set-attributes (self <gtk-label>)
  (attrs <pango-attr-list>)
set-attributes
  Sets a <pango-attr-list>; the attributes in the list are applied to the label text. The attributes set with this function will be ignored if the "use_underline" property or the "use_markup" property is '#t'.

  label a <gtk-label>
  attrs a <pango-attr-list>
```

```c
gtk-label-set-markup (self <gtk-label>) (str mchars)
set-markup
  Parses str which is marked up with the Pango text markup language, setting the label's text and attribute list based on the parse results. If the str is external data, you may need to escape it with g-markup-escape-text or g-markup-printf-escaped:

```
char *markup;

  markup = g_markup_printf_escaped ("<span style="italic">%s</span>", str);
  gtk_label_set_markup (GTK_LABEL (label), markup);
  g_free (markup);
```

  label a <gtk-label>
  str a markup string (see Pango markup format)
```

```c
gtk-label-set-markup-with-mnemonic (self <gtk-label>) (str mchars)
set-markup-with-mnemonic
  Parses str which is marked up with the Pango text markup language, setting the label's text and attribute list based on the parse results. If characters in str are preceded by an underscore, they are underlined indicating that they represent a keyboard accelerator called a mnemonic.

  The mnemonic key can be used to activate another widget, chosen automatically, or explicitly using gtk-label-set-mnemonic-widget.

  label a <gtk-label>
  str a markup string (see Pango markup format)
```

```c
gtk-label-set-pattern (self <gtk-label>) (pattern mchars)
set-pattern
  The pattern of underlines you want under the existing text within the <gtk-label> widget. For example if the current text of the label says "FooBarBaz" passing a pattern of "--- ---" will underline "Foo" and "Baz" but not "Bar".

  label The <gtk-label> you want to set the pattern to.
  pattern The pattern as described above.
```
Chapter 11: GtkLabel

gtk-label-set-justify (self <gtk-label>) (jtype <gtk-justification>)

set-justify
Sets the alignment of the lines in the text of the label relative to each other. ‘GTK_JUSTIFY_LEFT’ is the default value when the widget is first created with gtk-label-new. If you instead want to set the alignment of the label as a whole, use gtk-misc-set-alignment instead. gtk-label-set-justify has no effect on labels containing only a single line.

    label a <gtk-label>
    jtype a <gtk-justification>

gtk-label-set-ellipsize (self <gtk-label>) (mode <pango-ellipsize-mode>)

set-ellipsize
Sets the mode used to ellipsize (add an ellipsis: "...") to the text if there is not enough space to render the entire string.

    label a <gtk-label>
    mode a <pango-ellipsize-mode>

Since 2.6

gtk-label-set-width-chars (self <gtk-label>) (n_chars int)

set-width-chars
Sets the desired width in characters of label to n-chars.

    label a <gtk-label>
    n-chars the new desired width, in characters.

Since 2.6

gtk-label-set-max-width-chars (self <gtk-label>) (n_chars int)

set-max-width-chars
Sets the desired maximum width in characters of label to n-chars.

    label a <gtk-label>
    n-chars the new desired maximum width, in characters.

Since 2.6

gtk-label-set-line-wrap (self <gtk-label>) (wrap bool)

set-line-wrap
Toggles line wrapping within the <gtk-label> widget. ‘#t’ makes it break lines if text exceeds the widget’s size. ‘#f’ lets the text get cut off by the edge of the widget if it exceeds the widget size.

Note that setting line wrapping to ‘#t’ does not make the label wrap at its parent container’s width, because GTK+ widgets conceptually can’t make their requisition depend on the parent container’s size. For a label that wraps at a specific position, set the label’s width using gtk-widget-set-size-request.
label a <gtk-label>

wrap the setting

gtk-label-set-line-wrap-mode (self <gtk-label>) [Function]
    (wrap_mode <pango-wrap-mode>)

set-line-wrap-mode [Method]
If line wrapping is on (see gtk-label-set-line-wrap) this controls how the line wrapping is done. The default is ‘PANGO_WRAP_WORD’ which means wrap on word boundaries.

label a <gtk-label>

wrap-mode the line wrapping mode

Since 2.10

gtk-label-get-layout-offsets (self <gtk-label>) ⇒ (x int) [Function]
    (y int)

get-layout-offsets [Method]
Obtains the coordinates where the label will draw the <pango-layout> representing the text in the label; useful to convert mouse events into coordinates inside the <pango-layout>, e.g. to take some action if some part of the label is clicked. Of course you will need to create a <gtk-event-box> to receive the events, and pack the label inside it, since labels are a <gtk-no-window> widget. Remember when using the <pango-layout> functions you need to convert to and from pixels using pango-pixels or <pango-scale>.

label a <gtk-label>
x location to store X offset of layout, or ‘#f’
y location to store Y offset of layout, or ‘#f’

gtk-label-get-mnemonic-keyval (self <gtk-label>) [Function]
⇒ (ret unsigned-int)

get-mnemonic-keyval [Method]
If the label has been set so that it has an mnemonic key this function returns the keyval used for the mnemonic accelerator. If there is no mnemonic set up it returns <gdk--void-symbol>.

label a <gtk-label>
ret GDK keyval usable for accelerators, or <gdk--void-symbol>

gtk-label-get-selectable (self <gtk-label>) ⇒ (ret bool) [Function]

get-selectable [Method]
Gets the value set by gtk-label-set-selectable.

label a <gtk-label>
ret ‘#t’ if the user can copy text from the label
Chapter 11: GtkLabel

**gtk-label-get-text** *(self <gtk-label>) ⇒ (ret mchars)*

[Function]

Fetches the text from a label widget, as displayed on the screen. This does not include any embedded underlines indicating mnemonics or Pango markup. (See `gtk-label-get-label`)

*label* a `<gtk-label>`

*ret* the text in the label widget. This is the internal string used by the label, and must not be modified.

**gtk-label-new-with-mnemonic** *(str mchars) ⇒ (ret <gtk-widget>)*

[Function]

Creates a new `<gtk-label>`, containing the text in *str*.

If characters in *str* are preceded by an underscore, they are underlined. If you need a literal underscore character in a label, use '\_\_' (two underscores). The first underlined character represents a keyboard accelerator called a mnemonic. The mnemonic key can be used to activate another widget, chosen automatically, or explicitly using `gtk-label-set-mnemonic-widget`.

If `gtk-label-set-mnemonic-widget` is not called, then the first activatable ancestor of the `<gtk-label>` will be chosen as the mnemonic widget. For instance, if the label is inside a button or menu item, the button or menu item will automatically become the mnemonic widget and be activated by the mnemonic.

*str* The text of the label, with an underscore in front of the mnemonic character

*ret* the new `<gtk-label>`

**gtk-label-select-region** *(self <gtk-label>) (start_offset int) (end_offset int)*

[Function]

[Method]

Selects a range of characters in the label, if the label is selectable. See `gtk-label-set-selectable`. If the label is not selectable, this function has no effect. If `start-offset` or `end-offset` are -1, then the end of the label will be substituted.

*label* a `<gtk-label>`

*start-offset* start offset (in characters not bytes)

*end-offset* end offset (in characters not bytes)

**gtk-label-set-mnemonic-widget** *(self <gtk-label>) (widget <gtk-widget>)*

[Function]

[Method]

If the label has been set so that it has a mnemonic key (using i.e. `gtk-label-set-markup-with-mnemonic`, `gtk-label-set-text-with-mnemonic`, `gtk-label-new-with-mnemonic` or the "use_underline" property) the label can be associated with a widget that is the target of the mnemonic. When the label is inside a widget (like a `<gtk-button>` or a `<gtk-notebook>` tab) it is automatically associated with the correct widget, but sometimes (i.e. when the target is a `<gtk-entry>` next to the label) you need to set it explicitly using this function.
The target widget will be accelerated by emitting "mnemonic_activate" on it. The default handler for this signal will activate the widget if there are no mnemonic collisions and toggle focus between the colliding widgets otherwise.

```python
label       a <gtk-label>
widget      the target <gtk-widget>

gtk-label-set-selectable (self <gtk-label>) (setting bool) [Function]
set-selectable
Selectable labels allow the user to select text from the label, for copy-and-paste.

```python
label       a <gtk-label>
setting     '#t' to allow selecting text in the label
```
Since 2.6

`gtk-label-get-width-chars (self <gtk-label>) ⇒ (ret int)`  
`get-width-chars`  
Retrieves the desired width of `label`, in characters. See `gtk-label-set-width-chars`.

`label`  
a `<gtk-label>`

`ret`  
the width of the label in characters.

Since 2.6

`gtk-label-get-max-width-chars (self <gtk-label>) ⇒ (ret int)`  
`get-max-width-chars`  
Retrieves the desired maximum width of `label`, in characters. See `gtk-label-set-width-chars`.

`label`  
a `<gtk-label>`

`ret`  
the maximum width of the label in characters.

Since 2.6

`gtk-label-get-label (self <gtk-label>) ⇒ (ret mchars)`  
`get-label`  
Fetches the text from a label widget including any embedded underlines indicating mnemonics and Pango markup. (See `gtk-label-get-text`).

`label`  
a `<gtk-label>`

`ret`  
the text of the label widget. This string is owned by the widget and must not be modified or freed.

`gtk-label-get-layout (self <gtk-label>) ⇒ (ret <pango-layout>)`  
`get-layout`  
Gets the `<pango-layout>` used to display the label. The layout is useful to e.g. convert text positions to pixel positions, in combination with `gtk-label-get-layout-offsets`. The returned layout is owned by the label so need not be freed by the caller.

`label`  
a `<gtk-label>`

`ret`  
the `<pango-layout>` for this label

`gtk-label-get-line-wrap (self <gtk-label>) ⇒ (ret bool)`  
`get-line-wrap`  
Returns whether lines in the label are automatically wrapped. See `gtk-label-set-line-wrap`.

`label`  
a `<gtk-label>`

`ret`  
‘#t’ if the lines of the label are automatically wrapped.
gtk-label-get-line-wrap-mode (self <gtk-label>) ⇒ (ret <pango-wrap-mode>)

get-line-wrap-mode

Returns line wrap mode used by the label. See gtk-label-set-line-wrap-mode.

label a <gtk-label>
ret ‘#t’ if the lines of the label are automatically wrapped.

Since 2.10

gtk-label-get-mnemonic-widget (self <gtk-label>) ⇒ (ret <gtk-widget>)

get-mnemonic-widget

Retrieves the target of the mnemonic (keyboard shortcut) of this label. See gtk-label-set-mnemonic-widget.

label a <gtk-label>
ret the target of the label’s mnemonic, or ‘#f’ if none has been set and the default algorithm will be used.

gtk-label-get-selection-bounds (self <gtk-label>) ⇒ (ret bool) (start int) (end int)

get-selection-bounds

Gets the selected range of characters in the label, returning ‘#t’ if there’s a selection.

label a <gtk-label>
start return location for start of selection, as a character offset
end return location for end of selection, as a character offset
ret ‘#t’ if selection is non-empty

gtk-label-get-use-markup (self <gtk-label>) ⇒ (ret bool)

get-use-markup

Returns whether the label’s text is interpreted as marked up with the Pango text markup language. See gtk-label-set-use-markup.

label a <gtk-label>
ret ‘#t’ if the label’s text will be parsed for markup.

gtk-label-get-use-underline (self <gtk-label>) ⇒ (ret bool)

get-use-underline

Returns whether an embedded underline in the label indicates a mnemonic. See gtk-label-set-use-underline.

label a <gtk-label>
ret ‘#t’ whether an embedded underline in the label indicates the mnemonic accelerator keys.
Chapter 11: GtKLabel

gtk-label-get-single-line-mode (self <gtk-label>) ⇒ (ret bool) [Function]

get-single-line-mode
Returns whether the label is in single line mode.

label a <gtk-label>
ret ‘#t’ when the label is in single line mode.

Since 2.6

gtk-label-get-angle (self <gtk-label>) ⇒ (ret double) [Function]

get-angle
Gets the angle of rotation for the label. See gtk_label_set_angle.

label a <gtk-label>
ret the angle of rotation for the label

Since 2.6

gtk-label-set-label (self <gtk-label>) (str mchars) [Function]

set-label
Sets the text of the label. The label is interpreted as including embedded underlines and/or Pango markup depending on the values of label-use_underline and label-use_markup.

label a <gtk-label>
str the new text to set for the label

gtk-label-set-use-markup (self <gtk-label>) (setting bool) [Function]

set-use-markup
Sets whether the text of the label contains markup in Pango’s text markup language. See gtk-label-set-markup.

label a <gtk-label>
setting ‘#t’ if the label’s text should be parsed for markup.

gtk-label-set-use-underline (self <gtk-label>) (setting bool) [Function]

set-use-underline
If true, an underline in the text indicates the next character should be used for the mnemonic accelerator key.

label a <gtk-label>
setting ‘#t’ if underlines in the text indicate mnemonics

gtk-label-set-single-line-mode (self <gtk-label>) [Function]

set-single-line-mode
Sets whether the label is in single line mode.

label a <gtk-label>
single-line-mode
‘#t’ if the label should be in single line mode

Since 2.6
gtk-label-set-angle (self <gtk-label>) (angle double) [Function]

set-angle [Method]

Sets the angle of rotation for the label. An angle of 90 reads from from bottom to
top, an angle of 270, from top to bottom. The angle setting for the label is ignored
if the label is selectable, wrapped, or ellipsized.

label a <gtk-label>

angle the angle that the baseline of the label makes with the horizontal, in
degrees, measured counterclockwise

Since 2.6
12 GtkProgressBar

A widget which indicates progress visually

12.1 Overview

The `<gtk-progress-bar>` is typically used to display the progress of a long running operation. It provides a visual clue that processing is underway. The `<gtk-progress-bar>` can be used in two different modes: percentage mode and activity mode.

When an application can determine how much work needs to take place (e.g. read a fixed number of bytes from a file) and can monitor its progress, it can use the `<gtk-progress-bar>` in percentage mode and the user sees a growing bar indicating the percentage of the work that has been completed. In this mode, the application is required to call `gtk-progress-bar-set-fraction` periodically to update the progress bar.

When an application has no accurate way of knowing the amount of work to do, it can use the `<gtk-progress-bar>` in activity mode, which shows activity by a block moving back and forth within the progress area. In this mode, the application is required to call `gtk-progress-bar-pulse` periodically to update the progress bar.

There is quite a bit of flexibility provided to control the appearance of the `<gtk-progress-bar>`. Functions are provided to control the orientation of the bar, optional text can be displayed along with the bar, and the step size used in activity mode can be set.

The `<gtk-progress-bar>`/`<gtk-progress>` API in GTK 1.2 was bloated, needlessly complex and hard to use properly. Therefore `<gtk-progress>` has been deprecated completely and the `<gtk-progress-bar>` API has been reduced to the following 10 functions: `gtk-progress-bar-new`, `gtk-progress-bar-pulse`, `gtk-progress-bar-set-text`, `gtk-progress-bar-set-fraction`, `gtk-progress-bar-set-pulse-step`, `gtk-progress-bar-set-orientation`, `gtk-progress-bar-get-text`, `gtk-progress-bar-get-fraction`, `gtk-progress-bar-get-pulse-step`, `gtk-progress-bar-get-orientation`. These have been grouped at the beginning of this section, followed by a large chunk of deprecated 1.2 compatibility functions.

12.2 Usage

`<gtk-progress-bar>`

Derives from `<gtk-progress>`.

This class defines the following slots:

- **fraction** The fraction of total work that has been completed
- **pulse-step** The fraction of total progress to move the bouncing block when pulsed
- **orientation** Orientation and growth direction of the progress bar
- **text** Text to be displayed in the progress bar
ellipsize
The preferred place to ellipsize the string, if the progress bar does not have enough room to display the entire string, if at all.

adjustment
The GtkAdjustment connected to the progress bar (Deprecated)

bar-style
Specifies the visual style of the bar in percentage mode (Deprecated)

activity-step
The increment used for each iteration in activity mode (Deprecated)

activity-blocks
The number of blocks which can fit in the progress bar area in activity mode (Deprecated)

discrete-blocks
The number of discrete blocks in a progress bar (when shown in the discrete style)

gtk-progress-bar-new ⇒ (ret <gtk-widget>)
Creates a new <gtk-progress-bar>.

ret a <gtk-progress-bar>.

gtk-progress-bar-pulse (self <gtk-progress-bar>)
pulse
Indicates that some progress is made, but you don’t know how much. Causes the progress bar to enter "activity mode," where a block bounces back and forth. Each call to gtk-progress-bar-pulse causes the block to move by a little bit (the amount of movement per pulse is determined by gtk-progress-bar-set-pulse-step).

pbar a <gtk-progress-bar>

gtk-progress-bar-set-text (self <gtk-progress-bar>)
set-text
Causes the given text to appear superimposed on the progress bar.

pbar a <gtk-progress-bar>
text a UTF-8 string, or ‘#f’

gtk-progress-bar-set-fraction (self <gtk-progress-bar>)
set-fraction
Causes the progress bar to "fill in" the given fraction of the bar. The fraction should be between 0.0 and 1.0, inclusive.

pbar a <gtk-progress-bar>
fraction fraction of the task that’s been completed
gtk-progress-bar-set-pulse-step (self <gtk-progress-bar>) [Function]

(fraction double)

set-pulse-step [Method]
Sets the fraction of total progress bar length to move the bouncing block for each call to gtk-progress-bar-pulse.

pbar a <gtk-progress-bar>
fraction fraction between 0.0 and 1.0

gtk-progress-bar-set-orientation (self <gtk-progress-bar>) [Function]

(orientation <gtk-progress-bar-orientation>)

set-orientation [Method]
Causes the progress bar to switch to a different orientation (left-to-right, right-to-left, top-to-bottom, or bottom-to-top).

pbar a <gtk-progress-bar>
orientation orientation of the progress bar

gtk-progress-bar-set-ellipsize (self <gtk-progress-bar>) [Function]

(mode <pango-ellipsize-mode>)

set-ellipsize [Method]
Sets the mode used to ellipsize (add an ellipsis: "...") the text if there is not enough space to render the entire string.

pbar a <gtk-progress-bar>
mode a <pango-ellipsize-mode>

Since 2.6

gtk-progress-bar-get-text (self <gtk-progress-bar>) [Function]

⇒ (ret mchars)

get-text [Method]
Retrieves the text displayed superimposed on the progress bar, if any, otherwise ‘#f’. The return value is a reference to the text, not a copy of it, so will become invalid if you change the text in the progress bar.

pbar a <gtk-progress-bar>
ret text, or ‘#f’; this string is owned by the widget and should not be modified or freed.

gtk-progress-bar-get-fraction (self <gtk-progress-bar>) [Function]

⇒ (ret double)

get-fraction [Method]
Returns the current fraction of the task that’s been completed.

pbar a <gtk-progress-bar>
ret a fraction from 0.0 to 1.0
gtk-progress-bar-get-pulse-step (self <gtk-progress-bar>) ⇒ (ret double)

get-pulse-step

Retrieves the pulse step set with gtk-progress-bar-set-pulse-step

pbar a <gtk-progress-bar>
ret a fraction from 0.0 to 1.0

gtk-progress-bar-get-ellipsize (self <gtk-progress-bar>) ⇒ (ret <pango-ellipsize-mode>)

going-get-ellipsize

Returns the ellipsizing position of the progressbar. See gtk-progress-bar-set-ellipsize.

pbar a <gtk-progress-bar>
ret <pango-ellipsize-mode>

Since 2.6
13 GtkStatusBar

Report messages of minor importance to the user

13.1 Overview

A `<gtk-statusbar>` is usually placed along the bottom of an application's main `<gtk-window>`. It may provide a regular commentary of the application's status (as is usually the case in a web browser, for example), or may be used to simply output a message when the status changes, (when an upload is complete in an FTP client, for example). It may also have a resize grip (a triangular area in the lower right corner) which can be clicked on to resize the window containing the statusbar.

Status bars in Gtk+ maintain a stack of messages. The message at the top of the each bar's stack is the one that will currently be displayed.

Any messages added to a statusbar's stack must specify a context id that is used to uniquely identify the source of a message. This context_id can be generated by `gtk-statusbar-get-context-id`, given a message and the statusbar that it will be added to. Note that messages are stored in a stack, and when choosing which message to display, the stack structure is adhered to, regardless of the context identifier of a message.

Status bars are created using `gtk-statusbar-new`. Messages are added to the bar's stack with `gtk-statusbar-push`. The message at the top of the stack can be removed using `gtk-statusbar-pop`. A message can be removed from anywhere in the stack if its message_id was recorded at the time it was added. This is done using `gtk-statusbar-remove`.

13.2 Usage

`<gtk-statusbar>`

[Class]

Derives from `<gtk-hbox>`. This class defines the following slots:

has-resize-grip

Whether the statusbar has a grip for resizing the toplevel

text-pushed (arg0 <guint>) (arg1 <gchararray>)

[Signal on `<gtk-statusbar>`]

Is emitted whenever a new message gets pushed onto a statusbar's stack.

text-popped (arg0 <guint>) (arg1 <gchararray>)

[Signal on `<gtk-statusbar>`]

Is emitted whenever a new message is popped off a statusbar's stack.

gtk-statusbar-new ⇒ (ret <gtk-widget>)

[Function]

Creates a new `<gtk-statusbar>` ready for messages.

ret the new `<gtk-statusbar>`.

gtk-statusbar-get-context-id (self `<gtk-statusbar>`) (context_description mchars) ⇒ (ret unsigned-int)

[Function]

get-context-id

Returns a new context identifier, given a description of the actual context.
Chapter 13: GtkStatusbar

**statusbar** a `<gtk-statusbar>`.

**context-description**
- textual description of what context the new message is being used in.

**ret** an integer id.

```c
gtk-statusbar-push (self <gtk-statusbar>)
(context_id unsigned-int) (text mchars) ⇒ (ret unsigned-int)
```

**push**
- Pushes a new message onto a statusbar’s stack.

```c
statusbar a <gtk-statusbar>.
context-id the message’s context id, as returned by `gtk-statusbar-get-context-id`.
text the message to add to the statusbar.
ret the message’s new message id for use with `gtk-statusbar-remove`.
```

```c
gtk-statusbar-pop (self <gtk-statusbar>)
(context_id unsigned-int)
```

**pop**
- Removes the message at the top of a `<gtk-status-bar>`’s stack.

```c
statusbar a <gtk-status-bar>.
context-id a context identifier.
```

```c
gtk-statusbar-remove (self <gtk-statusbar>)
(context_id unsigned-int) (message_id unsigned-int)
```

**remove**
- Forces the removal of a message from a statusbar’s stack. The exact context-id and message-id must be specified.

```c
statusbar a <gtk-status-bar>.
context-id a context identifier.
message-id a message identifier, as returned by `gtk-statusbar-push`.
```

```c
gtk-statusbar-set-has-resize-grip (self <gtk-statusbar>)
(setting bool)
```

**set-has-resize-grip**
- Sets whether the statusbar has a resize grip. ‘#t’ by default.

```c
statusbar a <gtk-status-bar>.
setting ‘#t’ to have a resize grip.
```

```c
gtk-statusbar-get-has-resize-grip (self <gtk-statusbar>) ⇒ (ret bool)
```

**get-has-resize-grip**
- Returns whether the statusbar has a resize grip.
\texttt{statusbar} a \texttt{<gtk-status-bar>}.

\textit{ret} ‘\#t’ if the statusbar has a resize grip.
14 GtkStatusIcon

Display an icon in the system tray

14.1 Overview

The "system tray" or notification area is normally used for transient icons that indicate some special state. For example, a system tray icon might appear to tell the user that they have new mail, or have an incoming instant message, or something along those lines. The basic idea is that creating an icon in the notification area is less annoying than popping up a dialog.

A `<gtk-status-icon>` object can be used to display an icon in a "system tray". The icon can have a tooltip, and the user can interact with it by activating it or popping up a context menu. Critical information should not solely be displayed in a `<gtk-status-icon>`, since it may not be visible (e.g. when the user doesn’t have a notification area on his panel). This can be checked with `gtk-status-icon-is-embedded`.

On X11, the implementation follows the freedesktop.org "System Tray" specification. Implementations of the "tray" side of this specification can be found e.g. in the GNOME and KDE panel applications.

Note that a GtkStatusIcon is not a widget, but just a `<gobject>`. Making it a widget would be impractical, since the system tray on Win32 doesn’t allow to embed arbitrary widgets.

14.2 Usage

`<gtk-status-icon>`

Derives from `<gobject>`. This class defines the following slots:

- `pixbuf` A GdkPixbuf to display
- `file` Filename to load and display
- `stock` Stock ID for a stock image to display
- `icon-name` The name of the icon from the icon theme
- `storage-type` The representation being used for image data
- `size` The size of the icon
- `screen` The screen where this status icon will be displayed
- `visible` Whether or not the status icon is visible
- `orientation` The orientation of the tray
- `embedded` Whether or not the status icon is embedded
- `blinking` Whether or not the status icon is blinking
size-changed (arg0 <gint>) ⇒ <gboolean>  
[Signal on <gtk-status-icon>]
  Gets emitted when the size available for the image changes, e.g. because the notification area got resized.
  Since 2.10

popup-menu (arg0 <guint>) (arg1 <guint>)  
[Signal on <gtk-status-icon>]
  Gets emitted when the user brings up the context menu of the status icon. Whether status icons can have context menus and how these are activated is platform-dependent.
  The button and activate-timeout parameters should be passed as the last to arguments to gtk-menu-popup.
  Since 2.10

activate  
[Signal on <gtk-status-icon>]
  Gets emitted when the user activates the status icon. If and how status icons can activated is platform-dependent.
  Since 2.10

gtk-status-icon-new ⇒ (ret <gtk-status-icon>)  
[Function]
  Creates an empty status icon object.
  ret a new <gtk-status-icon>
  Since 2.10

gtk-status-icon-new-from-pixbuf (pixbuf <gdk-pixbuf>) ⇒ (ret <gtk-status-icon>)  
[Function]
  Creates a status icon displaying pixbuf. The image will be scaled down to fit in the available space in the notification area, if necessary.
  pixbuf a <gdk-pixbuf>
  ret a new <gtk-status-icon>
  Since 2.10

gtk-status-icon-new-from-file (filename mchars) ⇒ (ret <gtk-status-icon>)  
[Function]
  Creates a status icon displaying the file filename. The image will be scaled down to fit in the available space in the notification area, if necessary.
  filename a filename
  ret a new <gtk-status-icon>
  Since 2.10
Chapter 14: GtkStatusIcon

**gtk-status-icon-new-from-stock** (*stock_id mchars*)  
[Function]  
\[
\Rightarrow (\text{ret <gtk-status-icon>})
\]
Creates a status icon displaying a stock icon. Sample stock icon names are `<gtk-stock-open>`, `<gtk-stock-quit>`. You can register your own stock icon names, see `gtk-icon-factory-add-default` and `gtk-icon-factory-add`.

*stock-id* a stock icon id  
*ret* a new `<gtk-status-icon>`

Since 2.10

**gtk-status-icon-new-from-icon-name** (*icon_name mchars*)  
[Function]  
\[
\Rightarrow (\text{ret <gtk-status-icon>})
\]
Creates a status icon displaying an icon from the current icon theme. If the current icon theme is changed, the icon will be updated appropriately.

*icon-name* an icon name  
*ret* a new `<gtk-status-icon>`

Since 2.10

**gtk-status-icon-set-from-pixbuf** (*self <gtk-status-icon>*)  
(*pixbuf <gdk-pixbuf]*)  
[Method]  
set-from-pixbuf  
Makes *status-icon* display *pixbuf*. See `gtk-status-icon-new-from-pixbuf` for details.

*status-icon* a `<gtk-status-icon>`  
*pixbuf* a `<gdk-pixbuf>` or `'#f'

Since 2.10

**gtk-status-icon-set-from-file** (*self <gtk-status-icon>*)  
(*filename mchars*)  
[Method]  
set-from-file  
Makes *status-icon* display the file *filename*. See `gtk-status-icon-new-from-file` for details.

*status-icon* a `<gtk-status-icon>`  
*filename* a filename

Since 2.10

**gtk-status-icon-set-from-stock** (*self <gtk-status-icon>*)  
(*stock_id mchars*)  
[Method]  
set-from-stock  
Makes *status-icon* display the stock icon with the id *stock-id*. See `gtk-status-icon-new-from-stock` for details.
Chapter 14: GtkStatusIcon

status-icon
   a <gtk-status-icon>
stock-id    a stock icon id
Since 2.10

gtk-status-icon-set-from-icon-name (self <gtk-status-icon>) [Function]
   (icon_name mchars)
set-from-icon-name [Method]
   Makes status-icon display the icon named icon-name from the current icon theme.
   See gtk-status-icon-new-from-icon-name for details.
status-icon
   a <gtk-status-icon>
icon-name    an icon name
Since 2.10

gtk-status-icon-get-storage-type (self <gtk-status-icon>) [Function]
   ⇒ (ret <gtk-image-type>)
get-storage-type [Method]
   Gets the type of representation being used by the <gtk-status-icon> to store image data. If the <gtk-status-icon> has no image data, the return value will be ‘GTK_IMAGE_EMPTY’.
status-icon
   a <gtk-status-icon>
ret    the image representation being used
Since 2.10

gtk-status-icon-get-pixbuf (self <gtk-status-icon>) [Function]
   ⇒ (ret <gdk-pixbuf>)
get-pixbuf [Method]
   Gets the <gdk-pixbuf> being displayed by the <gtk-status-icon>. The storage type of the status icon must be ‘GTK_IMAGE_EMPTY’ or ‘GTK_IMAGE_PIXBUF’ (see gtk-status-icon-get-storage-type). The caller of this function does not own a reference to the returned pixbuf.
status-icon
   a <gtk-status-icon>
ret    the displayed pixbuf, or ‘#f’ if the image is empty.
Since 2.10

gtk-status-icon-get-stock (self <gtk-status-icon>) [Function]
   ⇒ (ret mchars)
get-stock [Method]
   Gets the id of the stock icon being displayed by the <gtk-status-icon>. The storage type of the status icon must be ‘GTK_IMAGE_EMPTY’ or ‘GTK_IMAGE_STOCK’ (see gtk-status-icon-get-storage-type). The returned string is owned by the <gtk-status-icon> and should not be freed or modified.
status-icon
  a <gtk-status-icon>
ret  stock id of the displayed stock icon, or ‘#f’ if the image is empty.
Since 2.10

gtk-status-icon-get-icon-name (self <gtk-status-icon>) ⇒ (ret mchars)
get-icon-name  [Method]
  Gets the name of the icon being displayed by the <gtk-status-icon>. The storage
type of the status icon must be ‘GTK_IMAGE_EMPTY’ or ‘GTK_IMAGE_ICON_NAME’ (see
gtk-status-icon-get-storage-type). The returned string is owned by the <gtk-
status-icon> and should not be freed or modified.
status-icon
  a <gtk-status-icon>
ret  name of the displayed icon, or ‘#f’ if the image is empty.
Since 2.10

gtk-status-icon-get-size (self <gtk-status-icon>) ⇒ (ret int)
get-size  [Method]
  Gets the size in pixels that is available for the image. Stock icons and named icons
adapt their size automatically if the size of the notification area changes. For other
storage types, the size-changed signal can be used to react to size changes.
status-icon
  a <gtk-status-icon>
ret  the size that is available for the image
Since 2.10

gtk-status-icon-set-tooltip (self <gtk-status-icon>)
  (tooltip_text mchars)
set-tooltip  [Method]
  Sets the tooltip of the status icon.
status-icon
  a <gtk-status-icon>
tooltip-text  the tooltip text, or ‘#f’
Since 2.10

gtk-status-icon-set-visible (self <gtk-status-icon>)
  (visible bool)
set-visible  [Method]
  Shows or hides a status icon.
status-icon
  a <gtk-status-icon>
visible  ‘#t’ to show the status icon, ‘#f’ to hide it

Since 2.10

gtk-status-icon-get-visible (self <gtk-status-icon>)  
⇒ (ret bool)

get-visible  [Method]
Returns whether the status icon is visible or not. Note that being visible does not
guarantee that the user can actually see the icon, see also gtk-status-icon-is-
embedded.

status-icon
    a <gtk-status-icon>
ret       ‘#t’ if the status icon is visible

Since 2.10

gtk-status-icon-set-blinking (self <gtk-status-icon>)  
(blinking bool)

set-blinking  [Method]
Makes the status icon start or stop blinking. Note that blinking user interface elements
may be problematic for some users, and thus may be turned off, in which case this
setting has no effect.

status-icon
    a <gtk-status-icon>
blinking  ‘#t’ to turn blinking on, ‘#f’ to turn it off

Since 2.10

gtk-status-icon-get-blinking (self <gtk-status-icon>)  
⇒ (ret bool)

get-blinking  [Method]
Returns whether the icon is blinking, see gtk-status-icon-set-blinking.

status-icon
    a <gtk-status-icon>
ret       ‘#t’ if the icon is blinking

Since 2.10

gtk-status-icon-is-embedded (self <gtk-status-icon>)  
⇒ (ret bool)
is-embedded  [Method]
Returns whether the status icon is embedded in a notification area.

status-icon
    a <gtk-status-icon>
ret       ‘#t’ if the status icon is embedded in a notification area.

Since 2.10
15 GtkButton

A widget that creates a signal when clicked on

15.1 Overview

The `<gtk-button>` widget is generally used to attach a function to that is called when the button is pressed. The various signals and how to use them are outlined below.

The `<gtk-button>` widget can hold any valid child widget. That is it can hold most any other standard `<gtk-widget>`. The most commonly used child is the `<gtk-label>`.

15.2 Usage

`<gtk-button>`

Derives from `<gtk-bin>`.

This class defines the following slots:

- `label`: Text of the label widget inside the button, if the button contains a label widget
- `image`: Child widget to appear next to the button text
- `relief`: The border relief style
- `use-underline`: If set, an underline in the text indicates the next character should be used for the mnemonic accelerator key
- `use-stock`: If set, the label is used to pick a stock item instead of being displayed
- `focus-on-click`: Whether the button grabs focus when it is clicked with the mouse
- `xalign`: Horizontal position of child in available space. 0.0 is left aligned, 1.0 is right aligned
- `yalign`: Vertical position of child in available space. 0.0 is top aligned, 1.0 is bottom aligned
- `image-position`: The position of the image relative to the text

activate

The "activate" signal on Gt kB utton is an action signal and emitting it causes the button to animate press then release. Applications should never connect to this signal, but use the "clicked" signal.

pressed

Emitted when the button is pressed.

deprecated: Use the GtkWidget::button-press-event signal.
released  
Emitted when the button is released.

deprecated: Use the GtkWidget::button-release-event signal.

clicked  
Emitted when the button has been activated (pressed and released).

center  
Emitted when the pointer enters the button.

deprecated: Use the GtkWidget::enter-notify-event signal.

leave  
Emitted when the pointer leaves the button.

deprecated: Use the GtkWidget::leave-notify-event signal.

gtk-button-new ⇒ (ret <gtk-widget>)  
Creates a new <gtk-button> widget. To add a child widget to the button, use gtk-container-add.

ret The newly created <gtk-button> widget.

gtk-button-new-with-label (label mchars) ⇒ (ret <gtk-widget>)  
Creates a <gtk-button> widget with a <gtk-label> child containing the given text.

label The text you want the <gtk-label> to hold.

ret The newly created <gtk-button> widget.

gtk-button-new-with-mnemonic (label mchars)  
⇒ (ret <gtk-widget>)
Creates a new <gtk-button> containing a label. If characters in label are preceded by an underscore, they are underlined. If you need a literal underscore character in a label, use '__' (two underscores). The first underlined character represents a keyboard accelerator called a mnemonic. Pressing Alt and that key activates the button.

label The text of the button, with an underscore in front of the mnemonic character

ret a new <gtk-button>

gtk-button-new-from-stock (stock_id mchars)  
⇒ (ret <gtk-widget>)
Creates a new <gtk-button> containing the image and text from a stock item. Some stock ids have preprocessor macros like <gtk-stock-ok> and <gtk-stock-apply>.

If stock-id is unknown, then it will be treated as a mnemonic label (as for gtk-button-new-with-mnemonic).

stock-id the name of the stock item

ret a new <gtk-button>
gtk-button-pressed (self <gtk-button>)

pressed

Emits a <gtk-button::pressed> signal to the given <gtk-button>.

button The <gtk-button> you want to send the signal to.

gtk-button-released (self <gtk-button>)

released

Emits a <gtk-button::released> signal to the given <gtk-button>.

button The <gtk-button> you want to send the signal to.

gtk-button-clicked (self <gtk-button>)

clicked

Emits a <gtk-button::clicked> signal to the given <gtk-button>.

button The <gtk-button> you want to send the signal to.

gtk-button-enter (self <gtk-button>)

enter

Emits a <gtk-button::enter> signal to the given <gtk-button>.

button The <gtk-button> you want to send the signal to.

gtk-button-leave (self <gtk-button>)

leave

Emits a <gtk-button::leave> signal to the given <gtk-button>.

button The <gtk-button> you want to send the signal to.

gtk-button-set-relief (self <gtk-button>)

(set-relief)

Sets the relief style of the edges of the given <gtk-button> widget. Three styles exist, GTK_RELIEF_NORMAL, GTK_RELIEF_HALF, GTK_RELIEF_NONE. The default style is, as one can guess, GTK_RELIEF_NORMAL.

button The <gtk-button> you want to set relief styles of.

newstyle The GtkReliefStyle as described above.

gtk-button-get-relief (self <gtk-button>)

⇒ (ret <gtk-relief-style>)

get-relief

Returns the current relief style of the given <gtk-button>.

button The <gtk-button> you want the <gtk-relief-style> from.

ret The current <gtk-relief-style>

gtk-button-get-label (self <gtk-button>) ⇒ (ret mchars)

get-label

Fetches the text from the label of the button, as set by gtk-button-set-label. If the label text has not been set the return value will be ‘#f’. This will be the case if you create an empty button with gtk-button-new to use as a container.
Chapter 15: GtkButton

button  a `<gtk-button>`

ret  The text of the label widget. This string is owned by the widget and must not be modified or freed.

gtk-button-set-label (self `<gtk-button>`) (label mchars)  [Function]
set-label  [Method]
Sets the text of the label of the button to `str`. This text is also used to select the stock item if `gtk-button-set-use-stock` is used.
This will also clear any previously set labels.

button  a `<gtk-button>`

label  a string

gtk-button-get-use-stock (self `<gtk-button>`) ⇒ (ret bool)  [Function]
get-use-stock  [Method]
Returns whether the button label is a stock item.

button  a `<gtk-button>`

ret  ‘#t’ if the button label is used to select a stock item instead of being used directly as the label text.

gtk-button-set-use-stock (self `<gtk-button>`) (use_stock bool)  [Function]
set-use-stock  [Method]
If true, the label set on the button is used as a stock id to select the stock item for the button.

button  a `<gtk-button>`

use-stock  ‘#t’ if the button should use a stock item

gtk-button-get-use-underline (self `<gtk-button>`) ⇒ (ret bool)  [Function]
get-use-underline  [Method]
Returns whether an embedded underline in the button label indicates a mnemonic. See `gtk-button-set-use-underline`.

button  a `<gtk-button>`

ret  ‘#t’ if an embedded underline in the button label indicates the mnemonic accelerator keys.

gtk-button-set-use-underline (self `<gtk-button>`)  [Function]
(use_underline bool)  [Method]
If true, an underline in the text of the button label indicates the next character should be used for the mnemonic accelerator key.

button  a `<gtk-button>`

use-underline  ‘#t’ if underlines in the text indicate mnemonics
Chapter 15: GtkButton

`gtk-button-set-focus-on-click (self <gtk-button>)`  [Function]

(set_focus_on_click bool)

**set-focus-on-click**  [Method]
Sets whether the button will grab focus when it is clicked with the mouse. Making mouse clicks not grab focus is useful in places like toolbars where you don’t want the keyboard focus removed from the main area of the application.

button  a <gtk-button>
focus-on-click  whether the button grabs focus when clicked with the mouse

Since 2.4

`gtk-button-get-focus-on-click (self <gtk-button>) ⇒ (ret bool)`  [Function]

**get-focus-on-click**  [Method]
Returns whether the button grabs focus when it is clicked with the mouse. See `gtk-button-set-focus-on-click`.

button  a <gtk-button>
ret  ‘#t’ if the button grabs focus when it is clicked with the mouse.

Since 2.4

`gtk-button-set-alignment (self <gtk-button>) (xalign float) (yalign float)`  [Function]

**set-alignment**  [Method]
Sets the alignment of the child. This property has no effect unless the child is a `<gtk-misc>` or a `<gtk-alignment>`.

button  a <gtk-button>
xalign  the horizontal position of the child, 0.0 is left aligned, 1.0 is right aligned
yalign  the vertical position of the child, 0.0 is top aligned, 1.0 is bottom aligned

Since 2.4

`gtk-button-get-alignment (self <gtk-button>) ⇒ (xalign float) (yalign float)`  [Function]

**get-alignment**  [Method]
Gets the alignment of the child in the button.

button  a <gtk-button>
xalign  return location for horizontal alignment
yalign  return location for vertical alignment

Since 2.4

`gtk-button-set-image (self <gtk-button>) (image <gtk-widget>)`  [Function]

**set-image**  [Method]
Set the image of `button` to the given widget. Note that it depends on the `gtk-button-images` setting whether the image will be displayed or not, you don’t have to call `gtk-widget-show` on `image` yourself.
button  a <gtk-button>
image  a widget to set as the image for the button

Since 2.6

**gtk-button-get-image** *(self <gtk-button>) ⇒ (ret <gtk-widget>)*  
**get-image**  
Gets the widget that is currently set as the image of button. This may have been explicitly set by **gtk-button-set-image** or constructed by **gtk-button-new-from-stock**.

*button*  a <gtk-button>
*ret*  a <gtk-widget> or ‘#f’ in case there is no image

Since 2.6

**gtk-button-set-image-position** *(self <gtk-button>)*  
*(position <gtk-position-type>)*  
**set-image-position**  
Sets the position of the image relative to the text inside the button.

*button*  a <gtk-button>
*position*  the position

Since 2.10

**gtk-button-get-image-position** *(self <gtk-button>)*  
⇒ *(ret <gtk-position-type>)*  
**get-image-position**  
Gets the position of the image relative to the text inside the button.

*button*  a <gtk-button>
*ret*  the position

Since 2.10
16 GtkCheckButton

Create widgets with a discrete toggle button

16.1 Overview

A `<gtk-check-button>` places a discrete `<gtk-toggle-button>` next to a widget, (usually a `<gtk-label>`). See the section on `<gtk-toggle-button>` widgets for more information about toggle/check buttons.

The important signal (‘toggled’) is also inherited from `<gtk-toggle-button>`.

16.2 Usage

```
<gtk-check-button>  [Class]
   Derives from `<gtk-toggle-button>`.
   This class defines no direct slots.

gtk-check-button-new ⇒ (ret <gtk-widget>)  [Function]
   Creates a new `<gtk-check-button>`.
   ret a `<gtk-widget>`.

gtk-check-button-new-with-label (label mchars) ⇒ (ret <gtk-widget>)  [Function]
   Creates a new `<gtk-check-button>` with a `<gtk-label>` to the right of it.
   label the text for the check button.
   ret a `<gtk-widget>`.

gtk-check-button-new-with-mnemonic (label mchars) ⇒ (ret <gtk-widget>)  [Function]
   Creates a new `<gtk-check-button>` containing a label. The label will be created using `gtk-label-new-with-mnemonic`, so underscores in `label` indicate the mnemonic for the check button.
   label The text of the button, with an underscore in front of the mnemonic character
   ret a new `<gtk-check-button>`
```
Chapter 17: GtkRadioButton

17 GtkRadioButton

A choice from multiple check buttons

17.1 Overview

A single radio button performs the same basic function as a `<gtk-check-button>`, as its position in the object hierarchy reflects. It is only when multiple radio buttons are grouped together that they become a different user interface component in their own right.

Every radio button is a member of some group of radio buttons. When one is selected, all other radio buttons in the same group are deselected. A `<gtk-radio-button>` is one way of giving the user a choice from many options.

Radio button widgets are created with `gtk-radio-button-new`, passing NULL as the argument if this is the first radio button in a group. In subsequent calls, the group you wish to add this button to should be passed as an argument. Optionally, `gtk-radio-button-new-with-label` can be used if you want a text label on the radio button.

Alternatively, when adding widgets to an existing group of radio buttons, use `gtk-radio-button-new-from-widget` with a `<gtk-radio-button>` that already has a group assigned to it. The convenience function `gtk-radio-button-new-with-label-from-widget` is also provided.

To retrieve the group a `<gtk-radio-button>` is assigned to, use `gtk-radio-button-get-group`.

To remove a `<gtk-radio-button>` from one group and make it part of a new one, use `gtk-radio-button-set-group`.

The group list does not need to be freed, as each `<gtk-radio-button>` will remove itself and its list item when it is destroyed.

```c
void create_radio_buttons (void) {

    window = gtk_window_new (GTK_WINDOW_TOPLEVEL);
    box = gtk_vbox_new (TRUE, 2);

    /* Create a radio button with a GtkEntry widget */
    radio1 = gtk_radio_button_new (NULL);
    entry = gtk_entry_new ();
    gtk_container_add (GTK_CONTAINER (radio1), entry);

    /* Create a radio button with a label */
    radio2 = gtk_radio_button_new_with_label_from_widget (GTK_RADIO_BUTTON (radio1),
        "I'm the second radio button.");

    /* Pack them into a box, then show all the widgets */
    gtk_box_pack_start (GTK_BOX (box), radio1, TRUE, TRUE, 2);
    gtk_box_pack_start (GTK_BOX (box), radio2, TRUE, TRUE, 2);
}
```
When an unselected button in the group is clicked the clicked button receives the "toggled" signal, as does the previously selected button. Inside the "toggled" handler, \texttt{gtk-toggle-button-get-active} can be used to determine if the button has been selected or deselected.

17.2 Usage

\texttt{<gtk-radio-button>}  

Derives from \texttt{<gtk-check-button>}.

This class defines the following slots:

- \texttt{group}  
  The radio button whose group this widget belongs to.

- \texttt{group-changed}  
  [Signal on \texttt{<gtk-radio-button>}]  
  Emitted when the group of radio buttons that a radio button belongs to changes.  
  This is emitted when a radio button switches from being alone to being part of a  
  group of 2 or more buttons, or vice-versa, and when a button is moved from one  
  group of 2 or more buttons to a different one, but not when the composition of the  
  group that a button belongs to changes.  
  Since 2.4

\texttt{gtk-radio-button-new (group <gtk-radio-group**)})  

[Function]  

\begin{verbatim}
⇒ (ret <gtk-widget>)
\end{verbatim}

Creates a new \texttt{<gtk-radio-button>}. To be of any practical value, a widget should  
then be packed into the radio button.

- \texttt{group}  
  an existing radio button group, or ‘\#f’ if you are creating a new group.

- \texttt{ret}  
  a new radio button.

\texttt{gtk-radio-button-new-from-widget (group <gtk-radio-button>)})  

[Function]  

\begin{verbatim}
⇒ (ret <gtk-widget>)
\end{verbatim}

Creates a new \texttt{<gtk-radio-button>}, adding it to the same group as \texttt{group}. As with  
\texttt{gtk-radio-button-new}, a widget should be packed into the radio button.

- \texttt{group}  
  an existing \texttt{<gtk-radio-button>}.  

- \texttt{ret}  
  a new radio button.

\texttt{gtk-radio-button-new-with-label (group <gtk-radio-group**)})  

[Function]  

\begin{verbatim}
(label mchars) ⇒ (ret <gtk-widget>)
\end{verbatim}

Creates a new \texttt{<gtk-radio-button>} with a text label.

- \texttt{group}  
  an existing radio button group, or ‘\#f’ if you are creating a new group.

- \texttt{label}  
  the text label to display next to the radio button.

- \texttt{ret}  
  a new radio button.
**gtk-radio-button-new-with-mnemonic**  
(\textit{group} <\texttt{gtk-radio-group*}>)(\textit{label} \texttt{mchars}) \Rightarrow (\textit{ret} <\texttt{gtk-widget}>)

Creates a new <\texttt{gtk-radio-button}> containing a label, adding it to the same group as \textit{group}. The label will be created using \texttt{gtk-label-new-with-mnemonic}, so underscores in \textit{label} indicate the mnemonic for the button.

- \textit{group} the radio button group
- \textit{label} the text of the button, with an underscore in front of the mnemonic character
- \textit{ret} a new <\texttt{gtk-radio-button}>

**gtk-radio-button-set-group** (\textit{self} <\texttt{gtk-radio-button}>)
(set-group)

(\textit{group} <\texttt{gtk-radio-group*}>)

\texttt{set-group}

Sets a <\texttt{gtk-radio-button}>’s group. It should be noted that this does not change the layout of your interface in any way, so if you are changing the group, it is likely you will need to re-arrange the user interface to reflect these changes.

- \textit{radio-button} a <\texttt{gtk-radio-button}>
- \textit{group} an existing radio button group, such as one returned from \texttt{gtk-radio-button-get-group}.

**gtk-radio-button-get-group** (\textit{self} <\texttt{gtk-radio-button}>)

\Rightarrow (\textit{ret} <\texttt{gtk-radio-group*}>)

\texttt{get-group}

Retrieves the group assigned to a radio button.

- \textit{radio-button} a <\texttt{gtk-radio-button}>
- \textit{ret} a linked list containing all the radio buttons in the same group as \texttt{radio-button}. 

18 GtkToggleButton

Create buttons which retain their state

18.1 Overview

A <gtk-toggle-button> is a <gtk-button> which will remain 'pressed-in' when clicked. Clicking again will cause the toggle button to return to its normal state.

A toggle button is created by calling either `gtk-toggle-button-new` or `gtk-toggle-button-new-with-label`. If using the former, it is advisable to pack a widget, (such as a <gtk-label> and/or a <gtk-pixmap>), into the toggle button’s container. (See <gtk-button> for more information).

The state of a <gtk-toggle-button> can be set specifically using `gtk-toggle-button-set-active`, and retrieved using `gtk-toggle-button-get-active`.

To simply switch the state of a toggle button, use `gtk_toggle_button_toggled`.

```c
void make_toggles (void) {
    GtkWidget *dialog, *toggle1, *toggle2;
    dialog = gtk_dialog_new ();
    toggle1 = gtk_toggle_button_new_with_label ("Hi, i’m a toggle button.");
    gtk_toggle_button_set_mode (GTK_TOGGLE_BUTTON (toggle1), TRUE);
    g_signal_connect (toggle1, "toggled",
                      G_CALLBACK (output_state), NULL);
    gtk_box_pack_start (GTK_BOX (GTK_DIALOG (dialog)->action_area),
                        toggle1, FALSE, FALSE, 2);
    toggle2 = gtk_toggle_button_new_with_label ("Hi, i’m another toggle button.");
    gtk_toggle_button_set_mode (GTK_TOGGLE_BUTTON (toggle2), FALSE);
    g_signal_connect (toggle2, "toggled",
                      G_CALLBACK (output_state), NULL);
    gtk_box_pack_start (GTK_BOX (GTK_DIALOG (dialog)->action_area),
                        toggle2, FALSE, FALSE, 2);
    gtk_widget_show_all (dialog);
}
```

18.2 Usage

<gtk-toggle-button> [Class]

Derives from <gtk-button>.

This class defines the following slots:
active If the toggle button should be pressed in or not

inconsistent If the toggle button is in an "in between" state

draw-indicator If the toggle part of the button is displayed

toggled [Signal on <gtk-toggle-button>] Should be connected if you wish to perform an action whenever the <gtk-toggle-button>'s state is changed.

gtk-toggle-button-new ⇒ (ret <gtk-widget>) [Function] Creates a new toggle button. A widget should be packed into the button, as in gtk-button-new.

  ret a new toggle button.

gtk-toggle-button-new-with-label (label mchars) [Function] ⇒ (ret <gtk-widget>) Creates a new toggle button with a text label.

  label a string containing the message to be placed in the toggle button.

  ret a new toggle button.

gtk-toggle-button-new-with-mnemonic (label mchars) [Function] ⇒ (ret <gtk-widget>) Creates a new <gtk-toggle-button> containing a label. The label will be created using gtk-label-new-with-mnemonic, so underscores in label indicate the mnemonic for the button.

  label the text of the button, with an underscore in front of the mnemonic character

  ret a new <gtk-toggle-button>

gtk-toggle-button-set-mode (self <gtk-toggle-button>) [Function] (draw_indicator bool) set-mode Sets whether the button is displayed as a separate indicator and label. You can call this function on a checkbutton or a radiobutton with draw-indicator = '#f' to make the button look like a normal button.

  This function only affects instances of classes like <gtk-check-button> and <gtk-radio-button> that derive from <gtk-toggle-button>, not instances of <gtk-toggle-button> itself.

  toggle-button a <gtk-toggle-button>

  draw-indicator if '#t', draw the button as a separate indicator and label; if '#f', draw the button like a normal button
Chapter 18: GtkToggleButton

```python
get-mode (self <gtk-toggle-button>) ⇒ (ret bool)

get-mode
Retrieves whether the button is displayed as a separate indicator and label. See gtk-toggle-button-set-mode.

toggle-button
a <gtk-toggle-button>

ret
‘#t’ if the togglebutton is drawn as a separate indicator and label.

get-active (self <gtk-toggle-button>) ⇒ (ret bool)

get-active
Queries a <gtk-toggle-button> and returns its current state. Returns ‘#t’ if the toggle button is pressed in and ‘#f’ if it is raised.

toggle-button
a <gtk-toggle-button>

ret
a <gboolean> value.

set-active (self <gtk-toggle-button>) (is_active bool)

set-active
Sets the status of the toggle button. Set to ‘#t’ if you want the GtkToggleButton to be ‘pressed in’, and ‘#f’ to raise it. This action causes the toggled signal to be emitted.

toggle-button
a <gtk-toggle-button>

is-active
‘#t’ or ‘#f’.

get-inconsistent (self <gtk-toggle-button>) ⇒ (ret bool)

get-inconsistent
Gets the value set by gtk-toggle-button-set-inconsistent.

toggle-button
a <gtk-toggle-button>

ret
‘#t’ if the button is displayed as inconsistent, ‘#f’ otherwise.
```
gtk-toggle-button-set-inconsistent (self <gtk-toggle-button>)  [Function]
(setting bool)

set-inconsistent  [Method]
If the user has selected a range of elements (such as some text or spreadsheet cells) that are affected by a toggle button, and the current values in that range are inconsistent, you may want to display the toggle in an "in between" state. This function turns on "in between" display. Normally you would turn off the inconsistent state again if the user toggles the toggle button. This has to be done manually, gtk-toggle-button-set-inconsistent only affects visual appearance, it doesn’t affect the semantics of the button.

toggle-button
 a <gtk-toggle-button>

setting  ‘#t’ if state is inconsistent
19 GtkLinkButton

Create buttons bound to a URL

19.1 Overview

A `<gtk-link-button>` is a `<gtk-button>` with a hyperlink, similar to the one used by web browsers, which triggers an action when clicked. It is useful to show quick links to resources.

A link button is created by calling either `gtk-link-button-new` or `gtk-link-button-new-with-label`. If using the former, the URI you pass to the constructor is used as a label for the widget.

The URI bound to a `<gtk-link-button>` can be set specifically using `gtk-link-button-set-uri`, and retrieved using `gtk-link-button-get-uri`.

<gtk-link-button> offers a global hook, which is called when the used clicks on it: see `gtk-link-button-set-uri-hook`.

<gtk-link-button> was added in GTK+ 2.10.

19.2 Usage

<gtk-link-button> [Class]

Derives from `<gtk-button>`.

This class defines the following slots:

- `uri` The URI bound to this button

`gtk-link-button-new (uri mchars) ⇒ (ret <gtk-widget>)` [Function]

Creates a new `<gtk-link-button>` with the URI as its text.

- `uri` a valid URI
- `ret` a new link button widget.

Since 2.10

`gtk-link-button-new-with-label (uri mchars) (label mchars) ⇒ (ret <gtk-widget>)` [Function]

Creates a new `<gtk-link-button>` containing a label.

- `uri` a valid URI
- `label` the text of the button
- `ret` a new link button widget.

Since 2.10

`gtk-link-button-get-uri (self <gtk-link-button>) ⇒ (ret mchars)` [Function]

`get-uri` [Method]

Retrieves the URI set using `gtk-link-button-set-uri`.

`link-button` [Class]

a `<gtk-link-button>`
ret a valid URI. The returned string is owned by the link button and should not be modified or freed.

Since 2.10

gtk-link-button-set-uri (self <gtk-link-button>) (uri mchars) [Function]
set-uri [Method]

Sets uri as the URI where the <gtk-link-button> points.

link-button
    a <gtk-link-button>

uri a valid URI

Since 2.10
20 GtkEntry

A single line text entry field

20.1 Overview

The `<gtk-entry>` widget is a single line text entry widget. A fairly large set of key bindings are supported by default. If the entered text is longer than the allocation of the widget, the widget will scroll so that the cursor position is visible.

20.2 Usage

`<gtk-entry>`

Derives from `<gtk-editable>`, `<gtk-cell-editable>`, `<gtk-widget>`. This class defines the following slots:

- **cursor-position**
  - The current position of the insertion cursor in chars

- **selection-bound**
  - The position of the opposite end of the selection from the cursor in chars

- **editable**
  - Whether the entry contents can be edited

- **max-length**
  - Maximum number of characters for this entry. Zero if no maximum

- **visibility**
  - FALSE displays the "invisible char" instead of the actual text (password mode)

- **has-frame**
  - FALSE removes outside bevel from entry

- **inner-border**
  - Border between text and frame. Overrides the inner-border style property

- **invisible-char**
  - The character to use when masking entry contents (in "password mode")

- **activates-default**
  - Whether to activate the default widget (such as the default button in a dialog) when Enter is pressed

- **width-chars**
  - Number of characters to leave space for in the entry

- **scroll-offset**
  - Number of pixels of the entry scrolled off the screen to the left

- **text**
  - The contents of the entry

- **xalign**
  - The horizontal alignment, from 0 (left) to 1 (right). Reversed for RTL layouts.
truncate-multiline
Whether to truncate multiline pastes to one line.

shadow-type
Which kind of shadow to draw around the entry when has-frame is set.

move-cursor (arg0 <gtk-movement-step>)
  (arg1 <gint>) (arg2 <gboolean>)
[Signal on <gtk-entry>]

copy-clipboard
[Signal on <gtk-entry>]

populate-popup (arg0 <gtk-menu>)
[Signal on <gtk-entry>]

activate
[Signal on <gtk-entry>]

insert-at-cursor (arg0 <gchararray>)
[Signal on <gtk-entry>]

delete-from-cursor (arg0 <gtk-delete-type>)
  (arg1 <gint>)
[Signal on <gtk-entry>]

backspace
[Signal on <gtk-entry>]

cut-clipboard
[Signal on <gtk-entry>]

paste-clipboard
[Signal on <gtk-entry>]

toggle-overwrite
[Signal on <gtk-entry>]

gtk-entry-set-text (self <gtk-entry>) (text mchars)
  [Function]
set-text
  [Method]

Sets the text in the widget to the given value, replacing the current contents.

entry a <gtk-entry>.
text the new text.

gtk-entry-get-text (self <gtk-entry>) ⇒ (ret mchars)
  [Function]
get-text
  [Method]

Retrieves the contents of the entry widget. See also gtk-editable-get-chars.

entry a <gtk-entry>
ret a pointer to the contents of the widget as a string. This string points to internally allocated storage in the widget and must not be freed, modified or stored.

gtk-entry-set-visibility (self <gtk-entry>) (visible bool)
  [Function]
set-visibility
  [Method]

Sets whether the contents of the entry are visible or not. When visibility is set to ‘#f’, characters are displayed as the invisible char, and will also appear that way when the text in the entry widget is copied elsewhere.

The default invisible char is the asterisk ‘*’, but it can be changed with gtk-entry-set-invisible-char.

entry a <gtk-entry>.
visible ‘#t’ if the contents of the entry are displayed as plaintext.
**gtk-entry-set-invisible-char** *(self <gtk-entry>)*

*Function*

(ch unsigned-int32)

**set-invisible-char**

Sets the character to use in place of the actual text when **gtk-entry-set-visibility** has been called to set text visibility to '#f', i.e. this is the character used in "password mode" to show the user how many characters have been typed. The default invisible char is an asterisk ('*'). If you set the invisible char to 0, then the user will get no feedback at all; there will be no text on the screen as they type.

*entry* a <gtk-entry>

*ch* a Unicode character

**gtk-entry-set-max-length** *(self <gtk-entry>) (max int)*

*Function*

**set-max-length**

Sets the maximum allowed length of the contents of the widget. If the current contents are longer than the given length, then they will be truncated to fit.

*entry* a <gtk-entry>.

*max* the maximum length of the entry, or 0 for no maximum. (other than the maximum length of entries.) The value passed in will be clamped to the range 0-65536.

**gtk-entry-get-activates-default** *(self <gtk-entry>)*

*Function*

⇒ (ret bool)

**get-activates-default**

Retrieves the value set by **gtk-entry-set-activates-default**.

*entry* a <gtk-entry>

*ret* ‘#t’ if the entry will activate the default widget

**gtk-entry-get-has-frame** *(self <gtk-entry>)* ⇒ (ret bool)

*Function*

**get-has-frame**

Gets the value set by **gtk-entry-set-has-frame**.

*entry* a <gtk-entry>

*ret* whether the entry has a beveled frame

**gtk-entry-get-inner-border** *(self <gtk-entry>)* ⇒ (ret <gtk-border>)

*Function*

**get-inner-border**

This function returns the entry’s inner-border property. See **gtk-entry-set-inner-border** for more information.

*entry* a <gtk-entry>

*ret* the entry’s <gtk-border>, or ‘#f’ if none was set.

Since 2.10
Chapter 20: GtkEntry

```bash
gtk-entry-get-width-chars (self <gtk-entry>) ⇒ (ret int)  [Function]
get-width-chars  [Method]

Gets the value set by gtk-entry-set-width-chars.

entry  a <gtk-entry>
ret  number of chars to request space for, or negative if unset
```

```bash
gtk-entry-set-activates-default (self <gtk-entry>)  [Function]
set-activates-default  [Method]

If setting is 't', pressing Enter in the entry will activate the default widget for the
window containing the entry. This usually means that the dialog box containing the
entry will be closed, since the default widget is usually one of the dialog buttons.
(For experts: if setting is 't', the entry calls gtk-window-activate-default on the
window containing the entry, in the default handler for the "activate" signal.)

entry  a <gtk-entry>
setting  't' to activate window's default widget on Enter keypress
```

```bash
gtk-entry-set-has-frame (self <gtk-entry>) (setting bool)  [Function]
set-has-frame  [Method]

Sets whether the entry has a beveled frame around it.

entry  a <gtk-entry>
setting  new value
```

```bash
gtk-entry-set-inner-border (self <gtk-entry>) (border <gtk-border>)  [Function]
set-inner-border  [Method]

Sets 'entry'’s inner-border property to 'border', or clears it if ‘f’ is passed. The
inner-border is the area around the entry's text, but inside its frame.
If set, this property overrides the inner-border style property. Overriding the style-
provided border is useful when you want to do in-place editing of some text in a
canvas or list widget, where pixel-exact positioning of the entry is important.

entry  a <gtk-entry>
border  a <gtk-border>, or ‘f’
```

Since 2.10

```bash
gtk-entry-set-width-chars (self <gtk-entry>) (n_chars int)  [Function]
set-width-chars  [Method]

Changes the size request of the entry to be about the right size for n-chars characters.
Note that it changes the size request, the size can still be affected by how you pack
the widget into containers. If n-chars is -1, the size reverts to the default entry size.

entry  a <gtk-entry>
n-chars  width in chars
```
Chapter 20:GtkEntry

gtk-entry-get-invisible-char (self <gtk-entry>) ⇒ (ret unsigned-int32)  
get-invisible-char  
Retrieves the character displayed in place of the real characters for entries with visibility set to false. See gtk-entry-set-invisible-char.
entry a <gtk-entry>
ret the current invisible char, or 0, if the entry does not show invisible text at all.

gtk-entry-set-alignment (self <gtk-entry>) (xalign float)  
set-alignment  
Sets the alignment for the contents of the entry. This controls the horizontal positioning of the contents when the displayed text is shorter than the width of the entry.
entry a <gtk-entry>
xalign The horizontal alignment, from 0 (left) to 1 (right). Reversed for RTL layouts
Since 2.4

gtk-entry-get-alignment (self <gtk-entry>) ⇒ (ret float)  
get-alignment  
Gets the value set by gtk-entry-set-alignment.
entry a <gtk-entry>
ret the alignment
Since 2.4

gtk-entry-get-layout (self <gtk-entry>) ⇒ (ret <pango-layout>)  
get-layout  
Gets the <pango-layout> used to display the entry. The layout is useful to e.g. convert text positions to pixel positions, in combination with gtk-entry-get-layout-offsets. The returned layout is owned by the entry and must not be modified or freed by the caller.
Keep in mind that the layout text may contain a preedit string, so gtk-entry-layout-index-to-text-index and gtk-entry-text-index-to-layout-index are needed to convert byte indices in the layout to byte indices in the entry contents.
entry a <gtk-entry>
ret the <pango-layout> for this entry

gtk-entry-get-layout-offsets (self <gtk-entry>) ⇒ (x int) (y int)  
get-layout-offsets  
Obtains the position of the <pango-layout> used to render text in the entry, in widget coordinates. Useful if you want to line up the text in an entry with some other text, e.g. when using the entry to implement editable cells in a sheet widget.
Also useful to convert mouse events into coordinates inside the `<pango-layout>`, e.g. to take some action if some part of the entry text is clicked.

Note that as the user scrolls around in the entry the offsets will change; you’ll need to connect to the "notify::scroll-offset" signal to track this. Remember when using the `<pango-layout>` functions you need to convert to and from pixels using `pango-pixels` or `<pango-scale>`.

Keep in mind that the layout text may contain a preedit string, so `gtk-entry-layout-index-to-text-index` and `gtk-entry-text-index-to-layout-index` are needed to convert byte indices in the layout to byte indices in the entry contents.

```
entry a <gtk-entry>
x location to store X offset of layout, or ‘#f’
y location to store Y offset of layout, or ‘#f’
```

```
[Function]
gtk-entry-get-max-length (self <gtk-entry>) ⇒ (ret int)
get-max-length
Retrieves the maximum allowed length of the text in `entry`. See `gtk-entry-set-max-length`.

entry a <gtk-entry>
ret the maximum allowed number of characters in `<gtk-entry>`, or 0 if there is no maximum.
```

```
[Function]
gtk-entry-get-visibility (self <gtk-entry>) ⇒ (ret bool)
get-visibility
Retrieves whether the text in `entry` is visible. See `gtk-entry-set-visibility`.

entry a <gtk-entry>
ret ‘#t’ if the text is currently visible
```

```
[Function]
gtk-entry-set-completion (self <gtk-entry>)
   (completion <gtk-entry-completion>)
set-completion
Sets `completion` to be the auxiliary completion object to use with `entry`. All further configuration of the completion mechanism is done on `completion` using the `<gtk-entry-completion>` API. Completion is disabled if `completion` is set to ‘#f’.

entry A <gtk-entry>.
completion The `<gtk-entry-completion>` or ‘#f’.
```

Since 2.4

```
[Function]
gtk-entry-get-completion (self <gtk-entry>)
   ⇒ (ret <gtk-entry-completion>)
get-completion
Returns the auxiliary completion object currently in use by `entry`.
entry A <gtk-entry>.
```
The auxiliary completion object currently in use by `entry`.

Since 2.4
Chapter 21: GtkEntryCompletion

Completion functionality for GtkEntry

21.1 Overview

\texttt{<gtk-entry-completion>\texttt{}} is an auxiliary object to be used in conjunction with \texttt{<gtk-entry>\texttt{}} to provide the completion functionality. It implements the \texttt{<gtk-cell-layout>\texttt{}} interface, to allow the user to add extra cells to the \texttt{<gtk-tree-view>\texttt{}} with completion matches.

"Completion functionality" means that when the user modifies the text in the entry, \texttt{<gtk-entry-completion>\texttt{}} checks which rows in the model match the current content of the entry, and displays a list of matches. By default, the matching is done by comparing the entry text case-insensitively against the text column of the model (see \texttt{gtk-entry-completion-set-text-column} ), but this can be overridden with a custom match function (see \texttt{gtk-entry-completion-set-match-func} ).

When the user selects a completion, the content of the entry is updated. By default, the content of the entry is replaced by the text column of the model, but this can be overridden by connecting to the ::match-selected signal and updating the entry in the signal handler. Note that you should return ‘#t’ from the signal handler to suppress the default behaviour.

To add completion functionality to an entry, use \texttt{gtk-entry-set-completion}. In addition to regular completion matches, which will be inserted into the entry when they are selected, \texttt{<gtk-entry-completion>\texttt{}} also allows to display "actions" in the popup window. Their appearance is similar to menuitems, to differentiate them clearly from completion strings. When an action is selected, the ::action-activated signal is emitted.

21.2 Usage

\texttt{<gtk-entry-completion>\texttt{}}

[Class]

Derives from \texttt{<gtk-buildable>, <gtk-cell-layout>, <gobject>\texttt{}}.

This class defines the following slots:

- \texttt{model} The model to find matches in
- \texttt{minimum-key-length} Minimum length of the search key in order to look up matches
- \texttt{text-column} The column of the model containing the strings.
- \texttt{inline-completion} Whether the common prefix should be inserted automatically
- \texttt{popup-completion} Whether the completions should be shown in a popup window
- \texttt{popup-set-width} If TRUE, the popup window will have the same size as the entry
- \texttt{popup-single-match} If TRUE, the popup window will appear for a single match.
### inline-selection

Your description here

**insert-prefix** (*arg0 <gchararray]*)  
⇒ <gboolean>  

Gets emitted when the inline autocompletion is triggered. The default behaviour is to make the entry display the whole prefix and select the newly inserted part.

Applications may connect to this signal in order to insert only a smaller part of the prefix into the entry - e.g. the entry used in the `<gtk-file-chooser>` inserts only the part of the prefix up to the next `/`.

Since 2.6

**match-selected** (*arg0 <gtk-tree-model>*)  
(*arg1 <gtk-tree-iter>) ⇒ <gboolean>  

Gets emitted when a match from the list is selected. The default behaviour is to replace the contents of the entry with the contents of the text column in the row pointed to by `iter`.

Since 2.4

**cursor-on-match** (*arg0 <gtk-tree-model>*)  
(*arg1 <gtk-tree-iter>) ⇒ <gboolean>  
undocumented

**action-activated** (*arg0 <gint]*)  

Gets emitted when an action is activated.

Since 2.4

**gtk-entry-completion-new**  
⇒ (*ret <gtk-entry-completion>*)  

Creates a new `<gtk-entry-completion>` object.

*ret* A newly created `<gtk-entry-completion>` object.

Since 2.4

**gtk-entry-completion-get-entry** (*self <gtk-entry-completion>*)  
⇒ (*ret <gtk-widget]*)  

**get-entry**  

Gets the entry `completion` has been attached to.

*completion* A `<gtk-entry-completion>`.

*ret* The entry `completion` has been attached to.

Since 2.4

**gtk-entry-completion-set-model** (*self <gtk-entry-completion>*)  
(*model <gtk-tree-model]*)  

**set-model**  

Sets the model for a `<gtk-entry-completion>`. If `completion` already has a model set, it will remove it before setting the new model. If model is `#f`, then it will unset the model.
**completion**  
A `<gtk-entry-completion>`.

**model**  
The `<gtk-tree-model>`.

Since 2.4

```c
gtk-entry-completion-get-model (self <gtk-entry-completion>) [Function]  
⇒ (ret <gtk-tree-model>)
```

**get-model**  
[Method]  
Returns the model the `<gtk-entry-completion>` is using as data source. Returns ‘#f’ if the model is unset.

**completion**  
A `<gtk-entry-completion>`.

**ret**  
A `<gtk-tree-model>`, or ‘#f’ if none is currently being used.

Since 2.4

```c
gtk-entry-completion-complete (self <gtk-entry-completion>) [Function]  
```

**complete**  
[Method]  
Requests a completion operation, or in other words a refiltering of the current list with completions, using the current key. The completion list view will be updated accordingly.

**completion**  
A `<gtk-entry-completion>`.

Since 2.4

```c
gtk-entry-completion-insert-prefix (self <gtk-entry-completion>) [Function]  
```

**insert-prefix**  
[Method]  
Requests a prefix insertion.

**completion**  
a `<gtk-entry-completion>`

Since 2.4

```c
gtk-entry-completion-delete-action (self <gtk-entry-completion>) (index int) [Function]  
```

**delete-action**  
[Method]  
Deletes the action at `index` from completion’s action list.

**completion**  
A `<gtk-entry-completion>`.

**index**  
The index of the item to Delete.

Since 2.4
Chapter 22: GtkHScale

22 GtkHScale

A horizontal slider widget for selecting a value from a range

22.1 Overview

The <gtk-hscale> widget is used to allow the user to select a value using a horizontal slider. To create one, use gtk-hscale-new-with-range.

The position to show the current value, and the number of decimal places shown can be set using the parent <gtk-scale> class’s functions.

22.2 Usage

<gtk-hscale> [Class]

Derives from <gtk-scale>. This class defines no direct slots.

gtk-hscale-new (adjustment <gtk-adjustment>) ⇒ (ret <gtk-widget>) [Function]

Creates a new <gtk-hscale>.

adjustment

the <gtk-adjustment> which sets the range of the scale.

ret

a new <gtk-hscale>.

gtk-hscale-new-with-range (min double) (max double) (step double) ⇒ (ret <gtk-widget>) [Function]

Creates a new horizontal scale widget that lets the user input a number between min and max (including min and max) with the increment step. step must be nonzero; it’s the distance the slider moves when using the arrow keys to adjust the scale value. Note that the way in which the precision is derived works best if step is a power of ten. If the resulting precision is not suitable for your needs, use gtk-scale-set-digits to correct it.

min

minimum value

max

maximum value

step

step increment (tick size) used with keyboard shortcuts

ret

a new <gtk-hscale>
23 GtkVScale

A vertical slider widget for selecting a value from a range

23.1 Overview

The `<gtk-vscale>` widget is used to allow the user to select a value using a vertical slider. To create one, use `gtk-hscale-new-with-range`.

The position to show the current value, and the number of decimal places shown can be set using the parent `<gtk-scale>` class’s functions.

23.2 Usage

```c
<gtk-vscale>
   [Class]
   Derives from `<gtk-scale>`.
   This class defines no direct slots.

   gtk-vscale-new (adjustment <gtk-adjustment>)
   ⇒ (ret <gtk-widget>)
   Creates a new `<gtk-vscale>`.
   
   adjustment
      the `<gtk-adjustment>` which sets the range of the scale.

   ret
      a new `<gtk-vscale>`.

gtk-vscale-new-with-range (min double) (max double)
   (step double) ⇒ (ret <gtk-widget>)
   Creates a new vertical scale widget that lets the user input a number between `min` and `max` (including `min` and `max`) with the increment `step`. `step` must be nonzero; it’s the distance the slider moves when using the arrow keys to adjust the scale value.
   Note that the way in which the precision is derived works best if `step` is a power of ten. If the resulting precision is not suitable for your needs, use `gtk-scale-set-digits` to correct it.

   min
      minimum value

   max
      maximum value

   step
      step increment (tick size) used with keyboard shortcuts

   ret
      a new `<gtk-vscale>`
```
24 GtkSpinButton

Retrieve an integer or floating-point number from the user

24.1 Overview

A `<gtk-spin-button>` is an ideal way to allow the user to set the value of some attribute. Rather than having to directly type a number into a `<gtk-entry>`, `<gtk-spin-button>` allows the user to click on one of two arrows to increment or decrement the displayed value. A value can still be typed in, with the bonus that it can be checked to ensure it is in a given range.

The main properties of a `<gtk-spin-button>` are through a `<gtk-adjustment>`. See the `<gtk-adjustment>` section for more details about an adjustment’s properties.

```c
/* Provides a function to retrieve an integer value from a GtkSpinButton and creates a spin button to model percentage values. */

#include <gtk/gtk.h>

gboolean grab_int_value (GtkSpinButton *a_spinner, gpointer user_data) {
    return gtk_spin_button_get_value_as_int (a_spinner);
}

void create_integer_spin_button (void) {
    GtkWidget *window, *spinner;
    GtkAdjustment *spinner_adj;

    spinner_adj = (GtkAdjustment *) gtk_adjustment_new (50.0, 0.0, 100.0, 1.0, 5.0, 5.0);
    window = gtk_window_new (GTK_WINDOW_TOplevel);
    gtk_container_set_border_width (GTK_CONTAINER (window), 5);
    spinner = gtk_spin_button_new (spinner_adj, 1.0, 0);
    gtk_container_add (GTK_CONTAINER (window), spinner);
    gtk_widget_show_all (window);
    return;
}

/* Provides a function to retrieve a floating point value from a GtkSpinButton, and creates a high precision spin button. */
```
Chapter 24: GtkSpinButton

```c
#define grab_int_value(GtkSpinButton *a_spinner, gpointer user_data) {
    return gtk_spin_button_get_value(a_spinner);
}

void create_floating_spin_button (void) {

    GtkWidget *window, *spinner;
    GtkAdjustment *spinner_adj;

    spinner_adj = (GtkAdjustment *) gtk_adjustment_new (2.500, 0.0, 5.0, 0.001, 0.1, 0.1);

    window = gtk_window_new (GTK_WINDOW_TOPLEVEL);
    gtk_container_set_border_width (GTK_CONTAINER (window), 5);

    /* creates the spinner, with three decimal places */
    spinner = gtk_spin_button_new (spinner_adj, 0.001, 3);
    gtk_container_add (GTK_CONTAINER (window), spinner);

    gtk_widget_show_all (window);
    return;
}
```

24.2 Usage

<_gtk-spin-button>_ [Class]

Derives from <gtk-entry>.

This class defines the following slots:

- **adjustment**
  - The adjustment that holds the value of the spinbutton
- **climb-rate**
  - The acceleration rate when you hold down a button
- **digits**
  - The number of decimal places to display
- **snap-to-ticks**
  - Whether erroneous values are automatically changed to a spin button’s nearest step increment
- **numeric**
  - Whether non-numeric characters should be ignored
- **wrap**
  - Whether a spin button should wrap upon reaching its limits
- **update-policy**
  - Whether the spin button should update always, or only when the value is legal
- **value**
  - Reads the current value, or sets a new value
value-changed [Signal on <gtk-spin-button>]
change-value (arg0 <gtk-scroll-type>) [Signal on <gtk-spin-button>]
input (arg0 <gpointer>) ⇒ <gint> [Signal on <gtk-spin-button>]
output ⇒ <gboolean> [Signal on <gtk-spin-button>]
wrapped [Signal on <gtk-spin-button>]

The wrapped signal is emitted right after the spinbutton wraps from its maximum to minimum value or vice-versa.

Since 2.10

gtk-spin-button-configure (self <gtk-spin-button>) [Function]
  (adjustment <gtk-adjustment>) (climb_rate double)
  (digits unsigned-int)
configure [Method]

Changes the properties of an existing spin button. The adjustment, climb rate, and number of decimal places are all changed accordingly, after this function call.

spin-button
  a <gtk-spin-button>.

adjustment
  a <gtk-adjustment>.

climb-rate
  the new climb rate.

digits
  the number of decimal places to display in the spin button.

gtk-spin-button-new (adjustment <gtk-adjustment>) [Function]
  (climb_rate double) (digits unsigned-int) ⇒ (ret <gtk-widget>)
Creates a new <gtk-spin-button>.

adjustment
  the <gtk-adjustment> object that this spin button should use.

climb-rate
  specifies how much the spin button changes when an arrow is clicked on.

digits
  the number of decimal places to display.

ret
  The new spin button as a <gtk-widget>.

gtk-spin-button-new-with-range (min double) (max double) [Function]
  (step double) ⇒ (ret <gtk-widget>)
This is a convenience constructor that allows creation of a numeric <gtk-spin-button> without manually creating an adjustment. The value is initially set to the minimum value and a page increment of 10 * step is the default. The precision of the spin button is equivalent to the precision of step.

Note that the way in which the precision is derived works best if step is a power of ten. If the resulting precision is not suitable for your needs, use gtk-spin-button-set-digits to correct it.

min
  Minimum allowable value
max  Maximum allowable value
step  Increment added or subtracted by spinning the widget
ret   The new spin button as a `<gtk-widget>`.

gtk-spin-button-set-adjustment (self `<gtk-spin-button>`) (adjustment `<gtk-adjustment>`)  [Function]
set-adjustment  [Method]
spins the `<gtk-adjustment>` associated with spin-button.

spin-button
  a `<gtk-spin-button>`

adjustment
  a `<gtk-adjustment>` to replace the existing adjustment

gtk-spin-button-get-adjustment (self `<gtk-spin-button>`) ⇒ (ret `<gtk-adjustment>`)  [Function]
get-adjustment  [Method]
Get the adjustment associated with a `<gtk-spin-button>`

spin-button
  a `<gtk-spin-button>`
ret  the `<gtk-adjustment>` of spin-button

gtk-spin-button-set-digits (self `<gtk-spin-button>`) (digits unsigned-int)  [Function]
set-digits  [Method]
Set the precision to be displayed by spin-button. Up to 20 digit precision is allowed.

spin-button
  a `<gtk-spin-button>`
digits  the number of digits after the decimal point to be displayed for the spin button’s value

gtk-spin-button-set-increments (self `<gtk-spin-button>`) (step double) (page double)  [Function]
set-increments  [Method]
Sets the step and page increments for spin_button. This affects how quickly the value changes when the spin button’s arrows are activated.

spin-button
  a `<gtk-spin-button>`
step  increment applied for a button 1 press.
page  increment applied for a button 2 press.

gtk-spin-button-set-range (self `<gtk-spin-button>`) (min double) (max double)  [Function]
set-range  [Method]
Sets the minimum and maximum allowable values for spin-button
spin-button  
a <gtk-spin-button>

min  minimum allowable value
max  maximum allowable value

\textbf{gtk-spin-button-get-value-as-int} \((\textit{self} <\text{gtk-spin-button}>)) \quad \textbf{[Function]}

⇒  \((\textit{ret} \text{ int})\)

\textbf{get-value-as-int} \quad \textbf{[Method]}

Get the value \textit{spin-button} represented as an integer.

spin-button  
a <gtk-spin-button>

ret  the value of \textit{spin-button}

\textbf{gtk-spin-button-set-value} \((\textit{self} <\text{gtk-spin-button}>)) \quad \textbf{[Function]}

\textbf{set-value} \quad \textbf{[Method]}

Set the value of \textit{spin-button}.

spin-button  
a <gtk-spin-button>

value  the new value

\textbf{gtk-spin-button-set-update-policy} \((\textit{self} <\text{gtk-spin-button}>)) \quad \textbf{[Function]}

\textbf{set-update-policy} \quad \textbf{[Method]}

Sets the update behavior of a spin button. This determines whether the spin button is always updated or only when a valid value is set.

spin-button  
a <gtk-spin-button>

policy  a <gtk-spin-button-update-policy> value

\textbf{gtk-spin-button-set-numeric} \((\textit{self} <\text{gtk-spin-button}>)) \quad \textbf{[Function]}

\textbf{set-numeric} \quad \textbf{[Method]}

Sets the flag that determines if non-numeric text can be typed into the spin button.

spin-button  
a <gtk-spin-button>

numeric  flag indicating if only numeric entry is allowed.

\textbf{gtk-spin-button-spin} \((\textit{self} <\text{gtk-spin-button}>)) \quad \textbf{[Function]}

\textbf{spin} \quad \textbf{[Method]}

Increment or decrement a spin button’s value in a specified direction by a specified amount.
Chapter 24: GtkSpinButton

```
spin-button
   a <gtk-spin-button>
direction a <gtk-spin-type> indicating the direction to spin.
increment step increment to apply in the specified direction.
```

```
gtk-spin-button-set-wrap (self <gtk-spin-button>) (wrap bool) [Function]
set-wrap [Method]
Sets the flag that determines if a spin button value wraps around to the opposite limit
when the upper or lower limit of the range is exceeded.
```

```
spin-button
   a <gtk-spin-button>
wrap a flag indicating if wrapping behavior is performed.
```

```
gtk-spin-button-set-snap-to-ticks (self <gtk-spin-button>) (snap_to_ticks bool) [Function]
set-snap-to-ticks [Method]
Sets the policy as to whether values are corrected to the nearest step increment when
a spin button is activated after providing an invalid value.
```

```
spin-button
   a <gtk-spin-button>
snap-to-ticks a flag indicating if invalid values should be corrected.
```

```
gtk-spin-button-update (self <gtk-spin-button>) [Function]
update [Method]
Manually force an update of the spin button.
```

```
spin-button
   a <gtk-spin-button>
```

```
gtk-spin-button-get-digits (self <gtk-spin-button>) ⇒ (ret unsigned-int) [Function]
get-digits [Method]
Fetches the precision of spin-button. See gtk-spin-button-set-digits.
```

```
spin-button
   a <gtk-spin-button>
ret the current precision
```

```
gtk-spin-button-get-increments (self <gtk-spin-button>) ⇒ (step double) (page double) [Function]
get-increments [Method]
Gets the current step and page the increments used by spin-button. See gtk-spin-
button-set-increments.
```

```
spin-button
   a <gtk-spin-button>
```
Chapter 24: GtkSpinButton

step  location to store step increment, or ‘#f’
page  location to store page increment, or ‘#f’

gtk-spin-button-get-numeric (self <gtk-spin-button>)  [Function]
⇒ (ret bool)
gtk-spin-button-get-range (self <gtk-spin-button>)  [Function]
⇒ (min double) (max double)
gtk-spin-button-get-snap-to-ticks (self <gtk-spin-button>)  [Function]
⇒ (ret bool)
gtk-spin-button-get-value (self <gtk-spin-button>)  [Function]
⇒ (ret double)
gtk-spin-button-get-wrap (self <gtk-spin-button>)  [Function]
⇒ (ret bool)

get-numeric  [Method]
Returns whether non-numeric text can be typed into the spin button. See gtk-spin-button-set-numeric.

spin-button
    a <gtk-spin-button>
ret  ‘#t’ if only numeric text can be entered

get-range  [Method]
Gets the range allowed for spin-button. See gtk-spin-button-set-range.

spin-button
    a <gtk-spin-button>
min  location to store minimum allowed value, or ‘#f’
max  location to store maximum allowed value, or ‘#f’

get-snap-to-ticks  [Method]
Returns whether the values are corrected to the nearest step. See gtk-spin-button-set-snap-to-ticks.

spin-button
    a <gtk-spin-button>
ret  ‘#t’ if values are snapped to the nearest step.

get-value  [Method]
Get the value in the spin-button.

spin-button
    a <gtk-spin-button>
ret  the value of spin-button

get-wrap  [Method]
Returns whether the spin button’s value wraps around to the opposite limit when the upper or lower limit of the range is exceeded. See gtk-spin-button-set-wrap.

spin-button
    a <gtk-spin-button>
ret  ‘#t’ if the spin button wraps around
25 GtkEditable

Interface for text-editing widgets

25.1 Overview

The <gtk-editable> interface is an interface which should be implemented by text editing widgets, such as <gtk-entry> and <gtk-text>. It contains functions for generically manipulating an editable widget, a large number of action signals used for key bindings, and several signals that an application can connect to to modify the behavior of a widget.

As an example of the latter usage, by connecting the following handler to "insert_text", an application can convert all entry into a widget into uppercase.

```c
#include <ctype.h>

void
insert_text_handler (GtkEditable *editable,
const gchar *text,
gint length,
gint *position,
gpointer data)
{
  int i;
  gchar *result = g_utf8_strup (text, length);

  g_signal_handlers_block_by_func (editable,
    (gpointer) insert_text_handler, data);
  gtk_editable_insert_text (editable, result, length, position);
  g_signal_handlers_unblock_by_func (editable,
    (gpointer) insert_text_handler, data);

  g_signal_stop_emission_by_name (editable, "insert_text");

  g_free (result);
}
```

25.2 Usage

<gtk-editable> [Class]

Derives from <ginterface>.

This class defines no direct slots.

changed [Signal on <gtk-editable>]

Indicates that the user has changed the contents of the widget.
insert-text \((arg0 <\text{gchararray}>)(arg1 <\text{gint}>)\) \([\text{Signal on }<\text{gtk-editable}>]\)
\((arg2 <\text{gpointer}>)\)
This signal is emitted when text is inserted into the widget by the user. The default handler for this signal will normally be responsible for inserting the text, so by connecting to this signal and then stopping the signal with \texttt{gtk-signal-emit-stop}, it is possible to modify the inserted text, or prevent it from being inserted entirely.

delete-text \((arg0 <\text{gint}>) (arg1 <\text{gint}>)\) \([\text{Signal on }<\text{gtk-editable}>]\)
This signal is emitted when text is deleted from the widget by the user. The default handler for this signal will normally be responsible for inserting the text, so by connecting to this signal and then stopping the signal with \texttt{gtk-signal-emit-stop}, it is possible to modify the inserted text, or prevent it from being inserted entirely. The \texttt{start-pos} and \texttt{end-pos} parameters are interpreted as for \texttt{gtk-editable-delete-text}.

gtk-editable-select-region \((self <\text{gtk-editable}>)(start \text{int})\) \([\text{Function}]\)
\((end \text{int})\)
select-region
Selects a region of text. The characters that are selected are those characters at positions from \texttt{start-pos} up to, but not including \texttt{end-pos}. If \texttt{end-pos} is negative, then the characters selected will be those characters from \texttt{start-pos} to the end of the text.

\begin{itemize}
  \item \texttt{editable} \quad a \texttt{<gtk-editable>} widget.
  \item \texttt{start} \quad the starting position.
  \item \texttt{end} \quad the end position.
\end{itemize}

gtk-editable-get-selection-bounds \((self <\text{gtk-editable}>)\) \([\text{Function}]\)
\Rightarrow \((\text{ret boolean}) (\text{start int}) (\text{end int})\)
get-selection-bounds
Gets the current selection bounds, if there is a selection.

\begin{itemize}
  \item \texttt{editable} \quad a \texttt{<gtk-editable>} widget.
  \item \texttt{start} \quad location to store the starting position, or ‘\#f’.
  \item \texttt{end} \quad location to store the end position, or ‘\#f’.
  \item \texttt{ret} \quad ‘\#t’ if there is a selection.
\end{itemize}

gtk-editable-insert-text \((self <\text{gtk-editable}>)(\text{new-text mchars}) (\text{position int})\) \Rightarrow \((\text{ret int})\)
insert-text
Inserts text at a given position.

\begin{itemize}
  \item \texttt{editable} \quad a \texttt{<gtk-editable>} widget.
  \item \texttt{new-text} \quad the text to insert.
  \item \texttt{new-text-length} \quad the length of the text to insert, in bytes
  \item \texttt{position} \quad an inout parameter. The caller initializes it to the position at which to insert the text. After the call it points at the position after the newly inserted text.
\end{itemize}
gtk-editable-delete-text (self <gtk-editable>) (start_pos int)  [Function]
(end_pos int)

delete-text  [Method]
Deletes a sequence of characters. The characters that are deleted are those characters
at positions from start-pos up to, but not including end-pos. If end-pos is negative,
then the the characters deleted will be those characters from start-pos to the end of
the text.

editable  a <gtk-editable> widget.
start-pos  the starting position.
end-pos  the end position.

gtk-editable-get-chars (self <gtk-editable>) (start_pos int)  [Function]
(end_pos int) ⇒ (ret mchars)

get-chars  [Method]
Retrieves a sequence of characters. The characters that are retrieved are those char-
acters at positions from start-pos up to, but not including end-pos. If end-pos is
negative, then the the characters retrieved will be those characters from start-pos to
the end of the text.

editable  a <gtk-editable> widget.
start-pos  the starting position.
end-pos  the end position.
ret  the characters in the indicated region. The result must be freed with
g-free when the application is finished with it.

gtk-editable-cut-clipboard (self <gtk-editable>)  [Function]
cut-clipboard  [Method]
Causes the characters in the current selection to be copied to the clipboard and then
deleted from the widget.

editable  a <gtk-editable> widget.

gtk-editable-copy-clipboard (self <gtk-editable>)  [Function]
copy-clipboard  [Method]
Causes the characters in the current selection to be copied to the clipboard.

editable  a <gtk-editable> widget.

gtk-editable-paste-clipboard (self <gtk-editable>)  [Function]
paste-clipboard  [Method]
Causes the contents of the clipboard to be pasted into the given widget at the current
cursor position.

editable  a <gtk-editable> widget.

gtk-editable-delete-selection (self <gtk-editable>)  [Function]
delete-selection  [Method]
Deletes the current contents of the widgets selection and disclaims the selection.

editable  a <gtk-editable> widget.
**gtk-editable-set-position** *(self <gtk-editable>)* *(position int)*

Sets the cursor position.

- **editable** a <gtk-editable> widget.
- **position** the position of the cursor. The cursor is displayed before the character with the given (base 0) index in the widget. The value must be less than or equal to the number of characters in the widget. A value of -1 indicates that the position should be set after the last character in the entry. Note that this position is in characters, not in bytes.

**gtk-editable-get-position** *(self <gtk-editable>)* ⇒ *(ret int)*

Retrieves the current cursor position.

- **editable** a <gtk-editable> widget.
- **ret** the position of the cursor. The cursor is displayed before the character with the given (base 0) index in the widget. The value will be less than or equal to the number of characters in the widget. Note that this position is in characters, not in bytes.

**gtk-editable-set-editable** *(self <gtk-editable>)* *(is-editable bool)*

Determines if the user can edit the text in the editable widget or not.

- **editable** a <gtk-editable> widget.
- **is-editable** ‘#t’ if the user is allowed to edit the text in the widget.

**gtk-editable-get-editable** *(self <gtk-editable>)* ⇒ *(ret bool)*

Retrieves whether editable is editable. See **gtk-editable-set-editable**.

- **editable** a <gtk-editable>
- **ret** ‘#t’ if editable is editable.
26 GtkTextIter

Text buffer iterator

26.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

26.2 Usage

<gtk-text-iter>  [Class]
    Derives from <gboxed>.
    This class defines no direct slots.

gtk-text-iter-get-buffer (self <gtk-text-iter>)  [Function]
    ⇒ (ret <gtk-text-buffer>)
    Returns the <gtk-text-buffer> this iterator is associated with.
    iter an iterator
    ret the buffer

gtk-text-iter-copy (self <gtk-text-iter>)  [Function]
    ⇒ (ret <gtk-text-iter>)
    Creates a dynamically-allocated copy of an iterator. This function is not useful in applications, because iterators can be copied with a simple assignment (`GtkTextIter i = j;`). The function is used by language bindings.
    iter an iterator
    ret a copy of the iter, free with gtk-text-iter-free

gtk-text-iter-get-offset (self <gtk-text-iter>) ⇒ (ret int)  [Function]
    Returns the character offset of an iterator. Each character in a <gtk-text-buffer> has an offset, starting with 0 for the first character in the buffer. Use gtk-text-buffer-get-iter-at-offset to convert an offset back into an iterator.
    iter an iterator
    ret a character offset

gtk-text-iter-get-line (self <gtk-text-iter>) ⇒ (ret int)  [Function]
    Returns the line number containing the iterator. Lines in a <gtk-text-buffer> are numbered beginning with 0 for the first line in the buffer.
    iter an iterator
    ret a line number
Chapter 26: GtTextIter

**gtk-text-iter-get-line-offset** *(self <gtk-text-iter>)*

⇒ (ret int)

Returns the character offset of the iterator, counting from the start of a newline-terminated line. The first character on the line has offset 0.

*iter* an iterator

*ret* offset from start of line

**gtk-text-iter-get-line-index** *(self <gtk-text-iter>)*

⇒ (ret int)

Returns the byte index of the iterator, counting from the start of a newline-terminated line. Remember that `<gtk-text-buffer>` encodes text in UTF-8, and that characters can require a variable number of bytes to represent.

*iter* an iterator

*ret* distance from start of line, in bytes

**gtk-text-iter-get-char** *(self <gtk-text-iter>)*

⇒ (ret unsigned-int32)

Returns the Unicode character at this iterator. (Equivalent to operator* on a C++ iterator.) If the element at this iterator is a non-character element, such as an image embedded in the buffer, the Unicode "unknown" character 0xFFFC is returned. If invoked on the end iterator, zero is returned; zero is not a valid Unicode character. So you can write a loop which ends when `gtk-text-iter-get-char` returns 0.

*iter* an iterator

*ret* a Unicode character, or 0 if *iter* is not dereferenceable

**gtk-text-iter-get-slice** *(self <gtk-text-iter>)*

(∗end <gtk-text-iter>∗) ⇒ (ret mchars)

Returns the text in the given range. A "slice" is an array of characters encoded in UTF-8 format, including the Unicode "unknown" character 0xFFFC for iterable non-character elements in the buffer, such as images. Because images are encoded in the slice, byte and character offsets in the returned array will correspond to byte offsets in the text buffer. Note that 0xFFFC can occur in normal text as well, so it is not a reliable indicator that a pixbuf or widget is in the buffer.

*start* iterator at start of a range

*end* iterator at end of a range

*ret* slice of text from the buffer

**gtk-text-iter-get-text** *(self <gtk-text-iter>)*

(∗end <gtk-text-iter>∗) ⇒ (ret mchars)

Returns text in the given range. If the range contains non-text elements such as images, the character and byte offsets in the returned string will not correspond to character and byte offsets in the buffer. If you want offsets to correspond, see `gtk-text-iter-get-slice`.

*start* iterator at start of a range
**gtk-text-iter-get-visible-slice** *(self <gtk-text-iter>)*

*(end <gtk-text-iter>)* ⇒ *(ret mchars)*

Like `gtk-text-iter-get-slice`, but invisible text is not included. Invisible text is usually invisible because a `<gtk-text-tag>` with the "invisible" attribute turned on has been applied to it.

*start* iterator at start of range

*end* iterator at end of range

*ret* array of characters from the buffer

**gtk-text-iter-get-visible-text** *(self <gtk-text-iter>)*

*(end <gtk-text-iter>)* ⇒ *(ret mchars)*

Like `gtk-text-iter-get-text`, but invisible text is not included. Invisible text is usually invisible because a `<gtk-text-tag>` with the "invisible" attribute turned on has been applied to it.

*start* iterator at start of range

*end* iterator at end of range

*ret* slice of text from the buffer

**gtk-text-iter-get-pixbuf** *(self <gtk-text-iter>)*

⇒ *(ret gdk-pixbuf)*

If the element at *iter* is a pixbuf, the pixbuf is returned (with no new reference count added). Otherwise, '#f' is returned.

*iter* an iterator

*ret* the pixbuf at *iter*

**gtk-text-iter-get-marks** *(self <gtk-text-iter>)*

⇒ *(ret gslist-of)*

Returns a list of all `<gtk-text-mark>` at this location. Because marks are not iterable (they don’t take up any "space" in the buffer, they are just marks in between iterable locations), multiple marks can exist in the same place. The returned list is not in any meaningful order.

*iter* an iterator

*ret* list of `<gtk-text-mark>`

**gtk-text-iter-get-toggled-tags** *(self <gtk-text-iter>)*

*(toggled_on bool)* ⇒ *(ret gslist-of)*

Returns a list of `<gtk-text-tag>` that are toggled on or off at this point. (If `toggled_on` is ‘#t’, the list contains tags that are toggled on.) If a tag is toggled on at *iter*, then some non-empty range of characters following *iter* has that tag applied to it. If a tag is toggled off, then some non-empty range following *iter* does not have the tag applied to it.
Chapter 26: GtkTextIter

iter an iterator

toggled-on ‘#t’ to get toggled-on tags

ret tags toggled at this point

gtk-text-iter-get-child-anchor (self <gtk-text-iter>) ⇒ (ret <gtk-text-child-anchor>)
If the location at iter contains a child anchor, the anchor is returned (with no new reference count added). Otherwise, ‘#f’ is returned.

iter an iterator

ret the anchor at iter

gtk-text-iter-begins-tag (self <gtk-text-iter>)
(tag <gtk-text-tag>) ⇒ (ret bool)
Returns ‘#t’ if tag is toggled on at exactly this point. If tag is ‘#f’, returns ‘#t’ if any tag is toggled on at this point. Note that the gtk-text-iter-begins-tag returns ‘#t’ if iter is the start of the tagged range; gtk-text-iter-has-tag tells you whether an iterator is within a tagged range.

iter an iterator

tag a <gtk-text-tag>, or ‘#f’

ret whether iter is the start of a range tagged with tag

gtk-text-iter-ends-tag (self <gtk-text-iter>)
(tag <gtk-text-tag>) ⇒ (ret bool)
Returns ‘#t’ if tag is toggled off at exactly this point. If tag is ‘#f’, returns ‘#t’ if any tag is toggled off at this point. Note that the gtk-text-iter-ends-tag returns ‘#t’ if iter is the end of the tagged range; gtk-text-iter-has-tag tells you whether an iterator is within a tagged range.

iter an iterator

tag a <gtk-text-tag>, or ‘#f’

ret whether iter is the end of a range tagged with tag

gtk-text-iter-toggles-tag (self <gtk-text-iter>)
(tag <gtk-text-tag>) ⇒ (ret bool)
This is equivalent to (gtk-text-iter-begins-tag || gtk-text-iter-ends-tag), i.e. it tells you whether a range with tag applied to it begins or ends at iter.

iter an iterator

tag a <gtk-text-tag>, or ‘#f’

ret whether tag is toggled on or off at iter

gtk-text-iter-has-tag (self <gtk-text-iter>)
(tag <gtk-text-tag>) ⇒ (ret bool)
Returns ‘#t’ if iter is within a range tagged with tag.

iter an iterator
Tag \textbf{a} \texttt{<gtk-text-tag>}

\textit{whether iter is tagged with tag}

\texttt{gtk-text-iter-get-tags (self \texttt{<gtk-text-iter>})} \hspace{1cm} \textbf{[Function]}

\Rightarrow (\texttt{ret \texttt{gslist-of}})

Returns a list of tags that apply to \textit{iter}, in ascending order of priority (highest-priority tags are last). The \texttt{<gtk-text-tag>} in the list don't have a reference added, but you have to free the list itself.

\textit{iter} \hspace{1cm} a \texttt{<gtk-text-iter>}

\textit{ret} \hspace{1cm} list of \texttt{<gtk-text-tag>}

\texttt{gtk-text-iter-editable (self \texttt{<gtk-text-iter>})} \hspace{1cm} \textbf{[Function]}

\textbf{(default-setting bool)} \Rightarrow (\texttt{ret bool})

Returns whether the character at \textit{iter} is within an editable region of text. Non-editable text is "locked" and can't be changed by the user via \texttt{<gtk-text-view>}. This function is simply a convenience wrapper around \texttt{gtk-text-iter-get-attributes}. If no tags applied to this text affect editability, \texttt{default-setting} will be returned.

You don’t want to use this function to decide whether text can be inserted at \textit{iter}, because for insertion you don’t want to know whether the char at \textit{iter} is inside an editable range, you want to know whether a new character inserted at \textit{iter} would be inside an editable range. Use \texttt{gtk-text-iter-can-insert} to handle this case.

\textit{iter} \hspace{1cm} an iterator

\textit{default-setting}

‘#t’ if text is editable by default

\textit{ret} \hspace{1cm} whether \textit{iter} is inside an editable range

\texttt{gtk-text-iter-can-insert (self \texttt{<gtk-text-iter>})} \hspace{1cm} \textbf{[Function]}

\textbf{(default-editability bool)} \Rightarrow (\texttt{ret bool})

Considering the default editability of the buffer, and tags that affect editability, determines whether text inserted at \textit{iter} would be editable. If text inserted at \textit{iter} would be editable then the user should be allowed to insert text at \textit{iter}. \texttt{gtk-text-buffer-insert-interactive} uses this function to decide whether insertions are allowed at a given position.

\textit{iter} \hspace{1cm} an iterator

\textit{default-editability}

‘#t’ if text is editable by default

\textit{ret} \hspace{1cm} whether text inserted at \textit{iter} would be editable

\texttt{gtk-text-iter-starts-word (self \texttt{<gtk-text-iter>})} \Rightarrow (\texttt{ret bool}) \hspace{1cm} \textbf{[Function]}

Determines whether \textit{iter} begins a natural-language word. Word breaks are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango word break algorithms).

\textit{iter} \hspace{1cm} a \texttt{<gtk-text-iter>}

\textit{ret} \hspace{1cm} ‘#t’ if \textit{iter} is at the start of a word
gtk-text-iter-ends-word (self <gtk-text-iter>) ⇒ (ret bool)  [Function]
Determines whether iter ends a natural-language word. Word breaks are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango word break algorithms).

iter  a <gtk-text-iter>
ret  ‘#t’ if iter is at the end of a word

gtk-text-iter-inside-word (self <gtk-text-iter>) ⇒ (ret bool)  [Function]
Determines whether iter is inside a natural-language word (as opposed to say inside some whitespace). Word breaks are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango word break algorithms).

iter  a <gtk-text-iter>
ret  ‘#t’ if iter is inside a word

gtk-text-iter-starts-line (self <gtk-text-iter>) ⇒ (ret bool)  [Function]
Returns ‘#t’ if iter begins a paragraph, i.e. if gtk-text-iter-get-line-offset would return 0. However this function is potentially more efficient than gtk-text-iter-get-line-offset because it doesn’t have to compute the offset, it just has to see whether it’s 0.

iter  an iterator
ret  whether iter begins a line

gtk-text-iter-ends-line (self <gtk-text-iter>) ⇒ (ret bool)  [Function]
Returns ‘#t’ if iter points to the start of the paragraph delimiter characters for a line (delimiters will be either a newline, a carriage return, a carriage return followed by a newline, or a Unicode paragraph separator character). Note that an iterator pointing to the \n of a \n\r pair will not be counted as the end of a line, the line ends before the \r. The end iterator is considered to be at the end of a line, even though there are no paragraph delimiter chars there.

iter  an iterator
ret  whether iter is at the end of a line

gtk-text-iter-starts-sentence (self <gtk-text-iter>)  [Function]
⇒ (ret bool)
Determines whether iter begins a sentence. Sentence boundaries are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango text boundary algorithms).

iter  a <gtk-text-iter>
ret  ‘#t’ if iter is at the start of a sentence.

gtk-text-iter-ends-sentence (self <gtk-text-iter>)  [Function]
⇒ (ret bool)
Determines whether iter ends a sentence. Sentence boundaries are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango text boundary algorithms).
iter       a <gtk-text-iter>
ret         ‘#t’ if iter is at the end of a sentence.

gtk-text-iter-inside-sentence (self <gtk-text-iter>) [Function]
⇒ (ret bool)
Determines whether iter is inside a sentence (as opposed to in between two sentences, e.g. after a period and before the first letter of the next sentence). Sentence boundaries are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango text boundary algorithms).

iter       a <gtk-text-iter>
ret         ‘#t’ if iter is inside a sentence.

gtk-text-iter-is-cursor-position (self <gtk-text-iter>) [Function]
⇒ (ret bool)
See gtk-text-iter-forward-cursor-position or <pango-log-attr> or pango-break for details on what a cursor position is.

iter       a <gtk-text-iter>
ret         ‘#t’ if the cursor can be placed at iter

gtk-text-iter-get-chars-in-line (self <gtk-text-iter>) [Function]
⇒ (ret int)
Returns the number of characters in the line containing iter, including the paragraph delimiters.

iter       an iterator
ret         number of characters in the line

gtk-text-iter-get-bytes-in-line (self <gtk-text-iter>) [Function]
⇒ (ret int)
Returns the number of bytes in the line containing iter, including the paragraph delimiters.

iter       an iterator
ret         number of bytes in the line

gtk-text-iter-get-attributes (self <gtk-text-iter>) [Function]
(values <gtk-text-attributes>) ⇒ (ret bool)
Computes the effect of any tags applied to this spot in the text. The values parameter should be initialized to the default settings you wish to use if no tags are in effect. You’d typically obtain the defaults from gtk-text-view-get-default-attributes.
gtk-text-iter-get-attributes will modify values, applying the effects of any tags present at iter. If any tags affected values, the function returns ‘#t’.

iter       an iterator
values     a <gtk-text-attributes> to be filled in
ret         ‘#t’ if values was modified
**gtk-text-iter-get-language** (self <gtk-text-iter>)

⇒ (ret <pango-language>)

A convenience wrapper around `gtk-text-iter-get-attributes`, which returns the language in effect at `iter`. If no tags affecting language apply to `iter`, the return value is identical to that of `gtk-get-default-language`.

`iter` an iterator

`ret` language in effect at `iter`

**gtk-text-iter-is-end** (self <gtk-text-iter>) ⇒ (ret bool)

Returns ‘#t’ if `iter` is the end iterator, i.e. one past the last dereferenceable iterator in the buffer. `gtk-text-iter-is-end` is the most efficient way to check whether an iterator is the end iterator.

`iter` an iterator

`ret` whether `iter` is the end iterator

**gtk-text-iter-is-start** (self <gtk-text-iter>) ⇒ (ret bool)

Returns ‘#t’ if `iter` is the first iterator in the buffer, that is if `iter` has a character offset of 0.

`iter` an iterator

`ret` whether `iter` is the first in the buffer

**gtk-text-iter-forward-char** (self <gtk-text-iter>)

⇒ (ret bool)

Moves `iter` forward by one character offset. Note that images embedded in the buffer occupy 1 character slot, so `gtk-text-iter-forward-char` may actually move onto an image instead of a character, if you have images in your buffer. If `iter` is the end iterator or one character before it, `iter` will now point at the end iterator, and `gtk-text-iter-forward-char` returns ‘#f’ for convenience when writing loops.

`iter` an iterator

`ret` whether `iter` moved and is dereferenceable

**gtk-text-iter-backward-char** (self <gtk-text-iter>)

⇒ (ret bool)

Moves backward by one character offset. Returns ‘#t’ if movement was possible; if `iter` was the first in the buffer (character offset 0), `gtk-text-iter-backward-char` returns ‘#f’ for convenience when writing loops.

`iter` an iterator

`ret` whether movement was possible

**gtk-text-iter-forward-chars** (self <gtk-text-iter>) (count int)

⇒ (ret bool)

Moves `count` characters if possible (if `count` would move past the start or end of the buffer, moves to the start or end of the buffer). The return value indicates whether the new position of `iter` is different from its original position, and dereferenceable (the last iterator in the buffer is not dereferenceable). If `count` is 0, the function does nothing and returns ‘#f’.
iter an iterator

count number of characters to move, may be negative

ret whether iter moved and is dereferenceable

**gtk-text-iter-backward-chars** *(self <gtk-text-iter>)* *(count int)*  [Function]

⇒ (ret bool)

Moves count characters backward, if possible (if count would move past the start or end of the buffer, moves to the start or end of the buffer). The return value indicates whether the iterator moved onto a dereferenceable position; if the iterator didn’t move, or moved onto the end iterator, then ‘#f’ is returned. If count is 0, the function does nothing and returns ‘#f’.

**gtk-text-iter-forward-line** *(self <gtk-text-iter>)* ⇒ (ret bool)  [Function]

Moves iter to the start of the next line. Returns ‘#t’ if there was a next line to move to, and ‘#f’ if iter was simply moved to the end of the buffer and is now not dereferenceable, or if iter was already at the end of the buffer.

**gtk-text-iter-backward-line** *(self <gtk-text-iter>)*  [Function]

⇒ (ret bool)

Moves iter to the start of the previous line. Returns ‘#t’ if iter could be moved; i.e. if iter was at character offset 0, this function returns ‘#f’. Therefore if iter was already on line 0, but not at the start of the line, iter is snapped to the start of the line and the function returns ‘#t’. (Note that this implies that in a loop calling this function, the line number may not change on every iteration, if your first iteration is on line 0.)

**gtk-text-iter-forward-lines** *(self <gtk-text-iter>)* *(count int)*  [Function]

⇒ (ret bool)

Moves count lines forward, if possible (if count would move past the start or end of the buffer, moves to the start or end of the buffer). The return value indicates whether the iterator moved onto a dereferenceable position; if the iterator didn’t move, or moved onto the end iterator, then ‘#f’ is returned. If count is 0, the function does nothing and returns ‘#f’. If count is negative, moves backward by 0 - count lines.
gtk-text-iter-backward-lines \( (self \langle gtk-text-iter\rangle) (count \text{ int}) \)  
⇒ \( (ret \text{ bool}) \)  
Moves \( count \) lines backward, if possible (if \( count \) would move past the start or end of the buffer, moves to the start or end of the buffer). The return value indicates whether the iterator moved onto a dereferenceable position; if the iterator didn’t move, or moved onto the end iterator, then ‘#f’ is returned. If \( count \) is 0, the function does nothing and returns ‘#f’. If \( count \) is negative, moves forward by \( 0 - count \) lines.

\ iteration \ a \langle gtk-text-iter\rangle 
\ count \ number of lines to move backward 
\ ret \ whether \ iteration \ moved and is dereferenceable

gtk-text-iter-forward-word-ends \( (self \langle gtk-text-iter\rangle) \)  
\( (count \text{ int}) \) ⇒ \( (ret \text{ bool}) \)  
Calls gtk-text-iter-forward-word-end up to \( count \) times.

\ iteration \ a \langle gtk-text-iter\rangle 
\ count \ number of times to move 
\ ret \ ‘#t’ if \ iteration \ moved and is not the end iterator

gtk-text-iter-backward-word-starts \( (self \langle gtk-text-iter\rangle) \)  
\( (count \text{ int}) \) ⇒ \( (ret \text{ bool}) \)  
Calls gtk-text-iter-backward-word-start up to \( count \) times.

\ iteration \ a \langle gtk-text-iter\rangle 
\ count \ number of times to move 
\ ret \ ‘#t’ if \ iteration \ moved and is not the end iterator

gtk-text-iter-forward-word-end \( (self \langle gtk-text-iter\rangle) \)  
⇒ \( (ret \text{ bool}) \)  
Moves forward to the next word end. (If \ iteration \ is currently on a word end, moves forward to the next one after that.) Word breaks are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango word break algorithms).

\ iteration \ a \langle gtk-text-iter\rangle 
\ ret \ ‘#t’ if \ iteration \ moved and is not the end iterator

gtk-text-iter-backward-word-start \( (self \langle gtk-text-iter\rangle) \)  
⇒ \( (ret \text{ bool}) \)  
Moves backward to the previous word start. (If \ iteration \ is currently on a word start, moves backward to the next one after that.) Word breaks are determined by Pango and should be correct for nearly any language (if not, the correct fix would be to the Pango word break algorithms).

\ iteration \ a \langle gtk-text-iter\rangle 
\ ret \ ‘#t’ if \ iteration \ moved and is not the end iterator
gtk-text-iter-forward-sentence-end (self <gtk-text-iter>) [Function]
⇒ (ret bool)
Moves forward to the next sentence end. (If iter is at the end of a sentence, moves to
the next end of sentence.) Sentence boundaries are determined by Pango and should
be correct for nearly any language (if not, the correct fix would be to the Pango text
boundary algorithms).

iter a <gtk-text-iter>
ret ‘#t’ if iter moved and is not the end iterator

gtk-text-iter-forward-sentence-ends (self <gtk-text-iter>) [Function]
(count int) ⇒ (ret bool)
Calls gtk-text-iter-forward-sentence-end count times (or until gtk-text-iter-
forward-sentence-end returns ‘#f’). If count is negative, moves backward instead
of forward.

iter a <gtk-text-iter>
count number of sentences to move
ret ‘#t’ if iter moved and is not the end iterator

gtk-text-iter-forward-visible-line (self <gtk-text-iter>) [Function]
⇒ (ret bool)
Moves iter to the start of the next visible line. Returns ‘#t’ if there was a next line
to move to, and ‘#f’ if iter was simply moved to the end of the buffer and is now not
dereferenceable, or if iter was already at the end of the buffer.

iter an iterator
ret whether iter can be dereferenced

Since 2.8

gtk-text-iter-backward-visible-line (self <gtk-text-iter>) [Function]
⇒ (ret bool)
Moves iter to the start of the previous visible line. Returns ‘#t’ if iter could be moved;
I.e. if iter was at character offset 0, this function returns ‘#f’. Therefore if iter was
already on line 0, but not at the start of the line, iter is snapped to the start of the
line and the function returns ‘#t’. (Note that this implies that in a loop calling this
function, the line number may not change on every iteration, if your first iteration is
on line 0.)

iter an iterator
ret whether iter moved

Since 2.8

gtk-text-iter-forward-visible-lines (self <gtk-text-iter>) [Function]
(count int) ⇒ (ret bool)
Moves count visible lines forward, if possible (if count would move past the start
or end of the buffer, moves to the start or end of the buffer). The return value
indicates whether the iterator moved onto a dereferenceable position; if the iterator didn’t move, or moved onto the end iterator, then ‘#f’ is returned. If count is 0, the function does nothing and returns ‘#f’. If count is negative, moves backward by 0 - count lines.

iter  a <gtk-text-iter>
count  number of lines to move forward
ret  whether iter moved and is dereferenceable

Since 2.8

gtk-text-iter-set-offset (self <gtk-text-iter>) (char_offset int)  [Function]
Sets iter to point to char-offset. char-offset counts from the start of the entire text buffer, starting with 0.

iter  a <gtk-text-iter>
char-offset  a character number

gtk-text-iter-set-line (self <gtk-text-iter>) (line_number int)  [Function]
Moves iterator iter to the start of the line line-number. If line-number is negative or larger than the number of lines in the buffer, moves iter to the start of the last line in the buffer.

iter  a <gtk-text-iter>
line-number  line number (counted from 0)

gtk-text-iter-set-line-offset (self <gtk-text-iter>) (char_on_line int)  [Function]
Moves iter within a line, to a new character (not byte) offset. The given character offset must be less than or equal to the number of characters in the line; if equal, iter moves to the start of the next line. See gtk-text-iter-set-line-index if you have a byte index rather than a character offset.

iter  a <gtk-text-iter>
char-on-line  a character offset relative to the start of iter’s current line

gtk-text-iter-set-line-index (self <gtk-text-iter>) (byte_on_line int)  [Function]
Same as gtk-text-iter-set-line-offset, but works with a byte index. The given byte index must be at the start of a character, it can’t be in the middle of a UTF-8 encoded character.

iter  a <gtk-text-iter>
byte-on-line  a byte index relative to the start of iter’s current line
gtk-text-iter-forward-to-end \( (\text{self} \ <\ \text{gtk-text-iter}) \) \[\text{Function}\] Moves \textit{iter} forward to the "end iterator," which points one past the last valid character in the buffer. \texttt{gtk-text-iter-get-char} called on the end iterator returns 0, which is convenient for writing loops.

\begin{itemize}
  \item \textit{iter} \quad \text{a} \ <\ \text{gtk-text-iter}
\end{itemize}

\texttt{gtk-text-iter-forward-to-line-end} \( (\text{self} \ <\ \text{gtk-text-iter}) \) \[\Rightarrow \ (\text{ret} \ \text{bool})\] Moves the iterator to point to the paragraph delimiter characters, which will be either a newline, a carriage return, a carriage return/newline in sequence, or the Unicode paragraph separator character. If the iterator is already at the paragraph delimiter characters, moves to the paragraph delimiter characters for the next line. If \textit{iter} is on the last line in the buffer, which does not end in paragraph delimiters, moves to the end iterator (end of the last line), and returns '#f'.

\begin{itemize}
  \item \textit{iter} \quad \text{a} \ <\ \text{gtk-text-iter}
  \item \text{ret} \quad '#t' \text{ if we moved and the new location is not the end iterator}
\end{itemize}

\texttt{gtk-text-iter-forward-to-tag-toggle} \( (\text{self} \ <\ \text{gtk-text-iter}) \) \[\text{Function}\] (\texttt{tag} \ <\ \text{gtk-text-tag}) \[\Rightarrow \ (\text{ret} \ \text{bool})\] Moves forward to the next toggle (on or off) of the \texttt{<gtk-text-tag>}\textit{tag}, or to the next toggle of any tag if \texttt{tag} is '#f'. If no matching tag toggles are found, returns '#f', otherwise '#t'. Does not return toggles located at \textit{iter}, only toggles after \textit{iter}. Sets \textit{iter} to the location of the toggle, or to the end of the buffer if no toggle is found.

\begin{itemize}
  \item \textit{iter} \quad \text{a} \ <\ \text{gtk-text-iter}
  \item \text{tag} \quad \text{a} \ <\ \text{gtk-text-tag}, \text{or} \ '#f'
  \item \text{ret} \quad \text{whether we found a tag toggle after} \ \textit{iter}
\end{itemize}

\texttt{gtk-text-iter-forward-search} \( (\text{self} \ <\ \text{gtk-text-iter}) \) \[\text{Function}\] \( (\text{str} \ \text{mchars}) \ \text{flags} <\ \text{gtk-text-search-flags}> \) (\texttt{match-start} \ <\ \text{gtk-text-iter}) (\texttt{match-end} \ <\ \text{gtk-text-iter}) \) \[\Rightarrow \ (\text{ret} \ \text{bool})\] Searches forward for \textit{str}. Any match is returned by setting \texttt{match-start} to the first character of the match and \texttt{match-end} to the first character after the match. The search will not continue past \textit{limit}. Note that a search is a linear or O(n) operation, so you may wish to use \textit{limit} to avoid locking up your UI on large buffers.

If the \texttt{<gtk-text-search-visible-only>} flag is present, the match may have invisible text interspersed in \textit{str}. i.e. \textit{str} will be a possibly-noncontiguous subsequence of the matched range. Similarly, if you specify \texttt{<gtk-text-search-text-only>}, the match may have pixbufs or child widgets mixed inside the matched range. If these flags are not given, the match must be exact; the special 0xFFFC character in \textit{str} will match embedded pixbufs or child widgets.

\begin{itemize}
  \item \textit{iter} \quad \text{start of search}
  \item \textit{str} \quad \text{a search string}
  \item \text{flags} \quad \text{flags affecting how the search is done}
\end{itemize}
match-start
return location for start of match, or ‘#f’

match-end
return location for end of match, or ‘#f’

limit
bound for the search, or ‘#f’ for the end of the buffer

ret
whether a match was found

gtk-text-iter-backward-search (self <gtk-text-iter>)
  (str mchars) (flags <gtk-text-search-flags>)
  (match_start <gtk-text-iter>) (match_end <gtk-text-iter>)
  (limit <gtk-text-iter>) ⇒ (ret bool)
Same as gtk-text-iter-forward-search, but moves backward.

iter
a <gtk-text-iter> where the search begins

str
search string

flags
bitmask of flags affecting the search

match-start
return location for start of match, or ‘#f’

match-end
return location for end of match, or ‘#f’

limit
location of last possible match-start, or ‘#f’ for start of buffer

ret
whether a match was found

gtk-text-iter-equal (self <gtk-text-iter>)
  (rhs <gtk-text-iter>) ⇒ (ret bool)
Tests whether two iterators are equal, using the fastest possible mechanism. This function is very fast; you can expect it to perform better than e.g. getting the character offset for each iterator and comparing the offsets yourself. Also, it’s a bit faster than gtk-text-iter-compare.

lhs
a <gtk-text-iter>

rhs
another <gtk-text-iter>

ret
‘#t’ if the iterators point to the same place in the buffer

gtk-text-iter-compare (self <gtk-text-iter>)
  (rhs <gtk-text-iter>) ⇒ (ret int)
A qsort-style function that returns negative if lhs is less than rhs, positive if lhs is greater than rhs, and 0 if they’re equal. Ordering is in character offset order, i.e. the first character in the buffer is less than the second character in the buffer.

lhs
a <gtk-text-iter>

rhs
another <gtk-text-iter>

ret
-1 if lhs is less than rhs, 1 if lhs is greater, 0 if they are equal
gtk-text-iter-in-range (self <gtk-text-iter>)  [Function]
   (start <gtk-text-iter>) (end <gtk-text-iter>) ⇒ (ret bool)
Checks whether iter falls in the range [start, end]. start and end must be in ascending order.
iter      a <gtk-text-iter>
start     start of range
end       end of range
ret       ‘#t’ if iter is in the range

gtk-text-iter-order (self <gtk-text-iter>)  [Function]
   (second <gtk-text-iter>)
Swaps the value of first and second if second comes before first in the buffer. That is, ensures that first and second are in sequence. Most text buffer functions that take a range call this automatically on your behalf, so there’s no real reason to call it yourself in those cases. There are some exceptions, such as gtk-text-iter-in-range, that expect a pre-sorted range.
first     a <gtk-text-iter>
second    another <gtk-text-iter>
27 GtkTextMark

A position in the buffer preserved across buffer modifications

27.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

A `<gtk-text-mark>` is like a bookmark in a text buffer; it preserves a position in the text. You can convert the mark to an iterator using `gtk-text-buffer-get-iter-at-mark`. Unlike iterators, marks remain valid across buffer mutations, because their behavior is defined when text is inserted or deleted. When text containing a mark is deleted, the mark remains in the position originally occupied by the deleted text. When text is inserted at a mark, a mark with left gravity will be moved to the beginning of the newly-inserted text, and a mark with right gravity will be moved to the end.

"left" and "right" here refer to logical direction (left is the toward the start of the buffer); in some languages such as Hebrew the logically-leftmost text is not actually on the left when displayed.

Marks are reference counted, but the reference count only controls the validity of the memory; marks can be deleted from the buffer at any time with `gtk-text-buffer-delete-mark`. Once deleted from the buffer, a mark is essentially useless.

Marks optionally have names; these can be convenient to avoid passing the `<gtk-text-mark>` object around.

Marks are typically created using the `gtk-text-buffer-create-mark` function.

27.2 Usage

`<gtk-text-mark>`

Derives from `<gobject>`.

This class defines the following slots:

- `name` Mark name
- `left-gravity` Whether the mark has left gravity

`gtk-text-mark-set-visible (self <gtk-text-mark>) (setting bool)`

Sets the visibility of mark; the insertion point is normally visible, i.e. you can see it as a vertical bar. Also, the text widget uses a visible mark to indicate where a drop will occur when dragging-and-dropping text. Most other marks are not visible. Marks are not visible by default.

- `mark` a `<gtk-text-mark>`
- `setting` visibility of mark
gtk-text-mark-get-visible \((self <\text{gtk-text-mark}>) \Rightarrow (ret \text{bool})\)  
\text{get-visible}  
Returns ‘#t’ if the mark is visible (i.e. a cursor is displayed for it)  
\text{mark} \quad \text{a} <\text{gtk-text-mark}>  
\text{ret} \quad \text{‘#t’ if visible}

gtk-text-mark-get-deleted \((self <\text{gtk-text-mark}>) \Rightarrow (ret \text{bool})\)  
\text{get-deleted}  
Returns ‘#t’ if the mark has been removed from its buffer with \text{gtk-text-buffer-delete-mark}. Marks can’t be used once deleted.  
\text{mark} \quad \text{a} <\text{gtk-text-mark}>  
\text{ret} \quad \text{whether the mark is deleted}

gtk-text-mark-get-name \((self <\text{gtk-text-mark}>) \Rightarrow (ret \text{mchars})\)  
\text{get-name}  
Returns the mark name; returns NULL for anonymous marks.  
\text{mark} \quad \text{a} <\text{gtk-text-mark}>  
\text{ret} \quad \text{mark name}

gtk-text-mark-get-buffer \((self <\text{gtk-text-mark}>) \Rightarrow (ret <\text{gtk-text-buffer}>)\)  
\text{get-buffer}  
Gets the buffer this mark is located inside, or NULL if the mark is deleted.  
\text{mark} \quad \text{a} <\text{gtk-text-mark}>  
\text{ret} \quad \text{the mark’s} <\text{gtk-text-buffer}>

gtk-text-mark-get-left-gravity \((self <\text{gtk-text-mark}>) \Rightarrow (ret \text{bool})\)  
\text{get-left-gravity}  
Determines whether the mark has left gravity.  
\text{mark} \quad \text{a} <\text{gtk-text-mark}>  
\text{ret} \quad \text{‘#t’ if the mark has left gravity, ‘#f’ otherwise}
28 GtkTextBuffer

Stores attributed text for display in a

28.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

28.2 Usage

<gtk-text-buffer> [Class]

Derives from <gobject>.
This class defines the following slots:

tag-table
  Text Tag Table
text
  Current text of the buffer
has-selection
  Whether the buffer has some text currently selected
cursor-position
  The position of the insert mark (as offset from the beginning of the buffer)
copy-target-list
  The list of targets this buffer supports for clipboard copying and DND source
paste-target-list
  The list of targets this buffer supports for clipboard pasting and DND destination

changed [Signal on <gtk-text-buffer>]
  The changed signal is emitted when the content of a <gtk-text-buffer> has changed.

insert-text (arg0 <gtk-text-iter>) (arg1 <gchararray>) (arg2 <gint>) [Signal on <gtk-text-buffer>]
  The insert_text signal is emitted to insert text in a <gtk-text-buffer>. Insertion actually occurs in the default handler.
  Note that if your handler runs before the default handler it must not invalidate the location iter (or has to revalidate it). The default signal handler revalidates it to point to the end of the inserted text.
  See also: gtk-text-buffer-insert, gtk-text-buffer-insert-range.

insert-pixbuf (arg0 <gtk-text-iter>) (arg1 <gdk-pixbuf>) [Signal on <gtk-text-buffer>]
  The insert_pixbuf signal is emitted to insert a <gdk-pixbuf> in a <gtk-text-buffer>. Insertion actually occurs in the default handler.
Note that if your handler runs before the default handler it must not invalidate the
(location iter (or has to revalidate it). The default signal handler revalidates it to be
placed after the inserted pixbuf.

See also: gtk-text-buffer-insert-pixbuf.

**insert-child-anchor**

```c
(insert-child-anchor arg0 <gtk-text-iter>)
```

[Signal on <gtk-text-buffer>]

The insert-child-anchor signal is emitted to insert a <gtk-text-child-anchor> in a
<gtk-text-buffer>. Insertion actually occurs in the default handler.

Note that if your handler runs before the default handler it must not invalidate the
(location iter (or has to revalidate it). The default signal handler revalidates it to be
placed after the inserted anchor.

See also: gtk-text-buffer-insert-child-anchor.

**delete-range**

```c
(delete-range arg0 <gtk-text-iter>)
```

[Signal on <gtk-text-buffer>]

The delete-range signal is emitted to delete a range from a <gtk-text-buffer>.

Note that if your handler runs before the default handler it must not invalidate the
(start and end iters (or has to revalidate them). The default signal handler revalidates
the start and end iters to both point point to the location where text was deleted.

Handlers which run after the default handler (see g-signal-connect-after) do not
have access to the deleted text.

See also: gtk-text-buffer-delete.

**modified-changed**

```c
(modified-changed)
```

[Signal on <gtk-text-buffer>]

The modified-changed signal is emitted when the modified bit of a <gtk-text-
buffer> flips.

See also: gtk-text-buffer-set-modified.

**mark-set**

```c
(mark-set arg0 <gtk-text-iter>)
```

[Signal on <gtk-text-buffer>]

The mark-set signal is emitted as notification after a <gtk-text-mark> is set.

See also: gtk-text-buffer-create-mark, gtk-text-buffer-move-mark.

**mark-deleted**

```c
(mark-deleted arg0 <gtk-text-mark>)
```

The mark-deleted signal is emitted as notification after a <gtk-text-mark> is deleted.

See also: gtk-text-buffer-delete-mark.

**apply-tag**

```c
(apply-tag arg0 <gtk-text-tag>)
```

[Signal on <gtk-text-buffer>]

The apply-tag signal is emitted to apply a tag to a range of text in a <gtk-text-
buffer>. Applying actually occurs in the default handler.

Note that if your handler runs before the default handler it must not invalidate the
(start and end iters (or has to revalidate them).

See also: gtk-text-buffer-apply-tag, gtk-text-buffer-insert-with-tags,
gtk-text-buffer-insert-range.
remove-tag (arg0 <gtk-text-tag>)  
(arg1 <gtk-text-iter>) (arg2 <gtk-text-iter>)  
[Signal on <gtk-text-buffer>]  
The remove-tag signal is emitted to remove all occurrences of tag from a range of text in a <gtk-text-buffer>. Removal actually occurs in the default handler. Note that if your handler runs before the default handler it must not invalidate the start and end iters (or has to revalidate them). See also: gtk-text-buffer-remove-tag.

begin-user-action  
[Signal on <gtk-text-buffer>]  
The begin-user-action signal is emitted at the beginning of a single user-visible operation on a <gtk-text-buffer>. See also: gtk-text-buffer-begin-user-action, gtk-text-buffer-insert-interactive, gtk-text-buffer-insert-range-interactive, gtk-text-buffer-delete-interactive, gtk-text-buffer-backspace, gtk-text-buffer-delete-selection.

del-user-action  
[Signal on <gtk-text-buffer>]  
The end-user-action signal is emitted at the end of a single user-visible operation <gtk-text-buffer>. See also: gtk-text-buffer-end-user-action, gtk-text-buffer-insert-interactive, gtk-text-buffer-insert-range-interactive, gtk-text-buffer-delete-interactive, gtk-text-buffer-backspace, gtk-text-buffer-delete-selection.

gtk-text-buffer-new (table <gtk-text-tag-table>)  
⇒ (ret <gtk-text-buffer>)  
[Function]  
Creates a new text buffer.  
table a tag table, or NULL to create a new one  
ret a new text buffer

gtk-text-buffer-get-line-count (self <gtk-text-buffer>)  
⇒ (ret int)  
[Function]  
get-line-count  
[Method]  
Obtains the number of lines in the buffer. This value is cached, so the function is very fast.  
buffer a <gtk-text-buffer>  
ret number of lines in the buffer

gtk-text-buffer-get-char-count (self <gtk-text-buffer>)  
⇒ (ret int)  
[Function]  
get-char-count  
[Method]  
Gets the number of characters in the buffer; note that characters and bytes are not the same, you can’t e.g. expect the contents of the buffer in string form to be this many bytes long. The character count is cached, so this function is very fast.  
buffer a <gtk-text-buffer>  
ret number of characters in the buffer
Chapter 28: GtkTextBuffer

**Function**

gtk-text-buffer-get-tag-table (self <gtk-text-buffer>)

⇒ (ret <gtk-text-tag-table>)

**Method**

get-tag-table

Get the <gtk-text-tag-table> associated with this buffer.

*buffer* a <gtk-text-buffer>

*ret* the buffer's tag table

**Function**

gtk-text-buffer-insert (self <gtk-text-buffer>)

(iter <gtk-text-iter>) (stext scm)

**Method**

insert

Inserts len bytes of text at position iter. If len is -1, text must be nul-terminated and will be inserted in its entirety. Emits the "insert_text" signal; insertion actually occurs in the default handler for the signal. iter is invalidated when insertion occurs (because the buffer contents change), but the default signal handler revalidates it to point to the end of the inserted text.

*buffer* a <gtk-text-buffer>

*iter* a position in the buffer

*text* UTF-8 format text to insert

*len* length of text in bytes, or -1

**Function**

gtk-text-buffer-insert-at-cursor (self <gtk-text-buffer>)

(stext scm)

**Method**

insert-at-cursor

Simply calls gtk-text-buffer-insert, using the current cursor position as the insertion point.

*buffer* a <gtk-text-buffer>

*text* some text in UTF-8 format

*len* length of text, in bytes

**Function**

gtk-text-buffer-insert-interactive (self <gtk-text-buffer>)

(iter <gtk-text-iter>) (stext scm) (default_editable bool) ⇒ (ret bool)

**Method**

insert-interactive

Like gtk-text-buffer-insert, but the insertion will not occur if iter is at a non-editable location in the buffer. Usually you want to prevent insertions at ineditable locations if the insertion results from a user action (is interactive).

default-editable indicates the editability of text that doesn’t have a tag affecting editability applied to it. Typically the result of gtk-text-view-get-editable is appropriate here.

*buffer* a <gtk-text-buffer>

*iter* a position in buffer

*text* some UTF-8 text

*len* length of text in bytes, or -1
default-editable
    default editability of buffer
ret
    whether text was actually inserted

**gtk-text-buffer-insert-range** *(self <gtk-text-buffer>)*  
    (iter <gtk-text-iter>) (start <gtk-text-iter>) (end <gtk-text-iter>)*

*insert-range*  
Copies text, tags, and pixbufs between *start* and *end* (the order of *start* and *end* doesn’t matter) and inserts the copy at *iter*. Used instead of simply getting/inserting text because it preserves images and tags. If *start* and *end* are in a different buffer from *buffer*, the two buffers must share the same tag table.

Implemented via emissions of the insert_text and apply_tag signals, so expect those.

*buffer*  
a <gtk-text-buffer>

*iter*  
a position in *buffer*

*start*  
a position in a <gtk-text-buffer>

*end*  
another position in the same buffer as *start*

**gtk-text-buffer-insert-with-tags** *(self <gtk-text-buffer>)*  
    (iter <gtk-text-iter>) (text scm) (tag_list glist-of)*

*insert-with-tags*  
Inserts *text* into *buffer* at *iter*, applying the list of tags to the newly-inserted text. The last tag specified must be NULL to terminate the list. Equivalent to calling *gtk-text-buffer-insert*, then *gtk-text-buffer-apply-tag* on the inserted text; *gtk-text-buffer-insert-with-tags* is just a convenience function.

*buffer*  
a <gtk-text-buffer>

*iter*  
an iterator in *buffer*

*text*  
UTF-8 text

*len*  
length of *text*, or -1

*first-tag*  
first tag to apply to *text*

...  
NULL-terminated list of tags to apply

**gtk-text-buffer-delete** *(self <gtk-text-buffer>)*  
    (start <gtk-text-iter>) (end <gtk-text-iter>)*

*delete*  
deletes text between *start* and *end*. The order of *start* and *end* is not actually relevant; *gtk-text-buffer-delete* will reorder them. This function actually emits the "delete_range" signal, and the default handler of that signal deletes the text. Because the buffer is modified, all outstanding iterators become invalid after calling this function; however, the *start* and *end* will be re-initialized to point to the location where text was deleted.

*buffer*  
a <gtk-text-buffer>

*start*  
a position in *buffer*

*end*  
another position in *buffer*
Chapter 28: GtkTextBuffer

```
gtk-text-buffer-delete-interactive (self <gtk-text-buffer>) (start_iter <gtk-text-iter>) (end_iter <gtk-text-iter>) (default_editable bool) ⇒ (ret bool)
delete-interactive

Deletes all editable text in the given range. Calls gtk-text-buffer-delete for each editable sub-range of [start,end]. start and end are revalidated to point to the location of the last deleted range, or left untouched if no text was deleted.

buffer a <gtk-text-buffer>
start-iter start of range to delete
end-iter end of range
default-editable
  whether the buffer is editable by default
ret
  whether some text was actually deleted
```

```
gtk-text-buffer-backspace (self <gtk-text-buffer>) (iter <gtk-text-iter>) (interactive bool) (default-editable bool) ⇒ (ret bool)
backspace

Performs the appropriate action as if the user hit the delete key with the cursor at the position specified by iter. In the normal case a single character will be deleted, but when combining accents are involved, more than one character can be deleted, and when precomposed character and accent combinations are involved, less than one character will be deleted.

Because the buffer is modified, all outstanding iterators become invalid after calling this function; however, the iter will be re-initialized to point to the location where text was deleted.

buffer a <gtk-text-buffer>
iter a position in buffer
interactive
  whether the deletion is caused by user interaction
default-editable
  whether the buffer is editable by default
ret ‘#t’ if the buffer was modified
```

Since 2.6

```
gtk-text-buffer-set-text (self <gtk-text-buffer>) (text scm) ⇒ (ret bool)
set-text

Deletes current contents of buffer, and inserts text instead. If len is -1, text must be nul-terminated. text must be valid UTF-8.

buffer a <gtk-text-buffer>
text UTF-8 text to insert
len length of text in bytes
```
```plaintext
(gtk-text-buffer-get-text (self <gtk-text-buffer>)) [Function]
    (start <gtk-text-iter>) (end <gtk-text-iter>)
    (include_hidden_chars bool) ⇒ (ret mchars)

get-text [Method]
Returns the text in the range [start,end). Excludes undisplayed text (text
marked with tags that set the invisibility attribute) if include-hidden-chars
is 'f'. Does not include characters representing embedded images, so byte
and character indexes into the returned string do not correspond to byte
and character indexes into the buffer. Contrast with gtk-text-buffer-get-slice.

buffer a <gtk-text-buffer>
start start of a range
end end of a range
include-hidden-chars whether to include invisible text
ret an allocated UTF-8 string

(gtk-text-buffer-get-slice (self <gtk-text-buffer>)) [Function]
    (start <gtk-text-iter>) (end <gtk-text-iter>)
    (include_hidden_chars bool) ⇒ (ret mchars)

get-slice [Method]
Returns the text in the range [start,end). Excludes undisplayed text (text marked
with tags that set the invisibility attribute) if include-hidden-chars is 'f'. The
returned string includes a 0xFFFC character whenever the buffer contains embedded
images, so byte and character indexes into the returned string do correspond to byte
and character indexes into the buffer. Contrast with gtk-text-buffer-get-text.
Note that 0xFFFC can occur in normal text as well, so it is not a reliable indicator
that a pixbuf or widget is in the buffer.

buffer a <gtk-text-buffer>
start start of a range
end end of a range
include-hidden-chars whether to include invisible text
ret an allocated UTF-8 string

(gtk-text-buffer-insert-pixbuf (self <gtk-text-buffer>)) [Function]
    (iter <gtk-text-iter>) (pixbuf <gdk-pixbuf>)

insert-pixbuf [Method]
Inserts an image into the text buffer at iter. The image will be counted as one
character in character counts, and when obtaining the buffer contents as a string, will
be represented by the Unicode "object replacement character" 0xFFFC. Note that the
"slice" variants for obtaining portions of the buffer as a string include this character
for pixbufs, but the "text" variants do not. e.g. see gtk-text-buffer-get-slice
and gtk-text-buffer-get-text.
```
buffer a <gtk-text-buffer>
iter location to insert the pixbuf
pixbuf a <gdk-pixbuf>

gtk-text-buffer-insert-child-anchor (self <gtk-text-buffer>) [Function]
(iter <gtk-text-iter>) (anchor <gtk-text-child-anchor>)
insert-child-anchor [Method]
Inserts a child widget anchor into the text buffer at iter. The anchor will be counted as one character in character counts, and when obtaining the buffer contents as a string, will be represented by the Unicode "object replacement character" (xFFFFC). Note that the "slice" variants for obtaining portions of the buffer as a string include this character for child anchors, but the "text" variants do not. e.g. see gtk-text-buffer-get-slice and gtk-text-buffer-get-text. Consider gtk-text-buffer-create-child-anchor as a more convenient alternative to this function. The buffer will add a reference to the anchor, so you can unref it after insertion.

buffer a <gtk-text-buffer>
iter location to insert the anchor
anchor a <gtk-text-child-anchor>

gtk-text-buffer-create-child-anchor (self <gtk-text-buffer>) [Function]
(iter <gtk-text-iter>) ⇒ (ret <gtk-text-child-anchor>)
create-child-anchor [Method]
This is a convenience function which simply creates a child anchor with gtk-text-child-anchor-new and inserts it into the buffer with gtk-text-buffer-insert-child-anchor. The new anchor is owned by the buffer; no reference count is returned to the caller of gtk-text-buffer-create-child-anchor.

buffer a <gtk-text-buffer>
iter location in the buffer
ret the created child anchor

gtk-text-buffer-create-mark (self <gtk-text-buffer>) [Function]
(mark_name mchars) (where <gtk-text-iter>) (left_gravity bool)
⇒ (ret <gtk-text-mark>)
create-mark [Method]
Creates a mark at position where. If mark-name is ‘#f’, the mark is anonymous; otherwise, the mark can be retrieved by name using gtk-text-buffer-get-mark. If a mark has left gravity, and text is inserted at the mark’s current location, the mark will be moved to the left of the newly-inserted text. If the mark has right gravity (left-gravity = ‘#f’), the mark will end up on the right of newly-inserted text. The standard left-to-right cursor is a mark with right gravity (when you type, the cursor stays on the right side of the text you’re typing).
The caller of this function does not own a reference to the returned <gtk-text-mark>, so you can ignore the return value if you like. Marks are owned by the buffer and go away when the buffer does.
Emits the "mark_set" signal as notification of the mark’s initial placement.
buffer  a <gtk-text-buffer>

mark-name  
name for mark, or ‘#f’

where  location to place mark

left-gravity  
whether the mark has left gravity

ret  the new <gtk-text-mark> object

```c
gtk-text-buffer-move-mark (self <gtk-text-buffer>)
(mark <gtk-text-mark>) (where <gtk-text-iter>)
```

**move-mark**  
Moves *mark* to the new location *where*. Emits the "mark_set" signal as notification of the move.

```c
buffer  a <gtk-text-buffer>
mark  a <gtk-text-mark>
where  new location for *mark* in *buffer*
```

```c
gtk-text-buffer-move-mark-by-name (self <gtk-text-buffer>)
(name mchars) (where <gtk-text-iter>)
```

**move-mark-by-name**  
Moves the mark named *name* (which must exist) to location *where*. See gtk-text-buffer-move-mark for details.

```c
buffer  a <gtk-text-buffer>
name  name of a mark
where  new location for *mark*
```

```c
gtk-text-buffer-delete-mark (self <gtk-text-buffer>)
(mark <gtk-text-mark>)
```

**delete-mark**  
Deletes *mark*, so that it’s no longer located anywhere in the buffer. Removes the reference the buffer holds to the mark, so if you haven’t called g-object-ref on the mark, it will be freed. Even if the mark isn’t freed, most operations on *mark* become invalid. There is no way to undelete a mark. gtk-text-mark-get-deleted will return TRUE after this function has been called on a mark; gtk-text-mark-get-deleted indicates that a mark no longer belongs to a buffer. The "mark_deleted" signal will be emitted as notification after the mark is deleted.

```c
buffer  a <gtk-text-buffer>
mark  a <gtk-text-mark> in *buffer*
```

```c
gtk-text-buffer-delete-mark-by-name (self <gtk-text-buffer>)
(name mchars)
```

**delete-mark-by-name**  
Deletes the mark named *name*; the mark must exist. See gtk-text-buffer-delete-mark for details.
buffer    a <gtk-text-buffer>
name     name of a mark in buffer

gtk-text-buffer-get-mark (self <gtk-text-buffer>)    [Function]
(name mchars) ⇒ (ret <gtk-text-mark>)

get-mark    [Method]
Returns the mark named name in buffer buffer, or NULL if no such mark exists in the buffer.

buffer    a <gtk-text-buffer>
name     a mark name
ret     a <gtk-text-mark>, or NULL

gtk-text-buffer-get-insert (self <gtk-text-buffer>)    [Function]
⇒ (ret <gtk-text-mark>)

get-insert    [Method]
Returns the mark that represents the cursor (insertion point). Equivalent to calling
gtk-text-buffer-get-mark to get the mark named "insert", but very slightly more efficient, and involves less typing.

buffer    a <gtk-text-buffer>
ret     insertion point mark

gtk-text-buffer-get-selection-bound (self <gtk-text-buffer>)    [Function]
⇒ (ret <gtk-text-mark>)

get-selection-bound    [Method]
Returns the mark that represents the selection bound. Equivalent to calling gtk-text-buffer-get-mark to get the mark named "selection_bound", but very slightly more efficient, and involves less typing.

The currently-selected text in buffer is the region between the "selection_bound" and "insert" marks. If "selection_bound" and "insert" are in the same place, then there is no current selection. gtk-text-buffer-get-selection-bounds is another convenient function for handling the selection, if you just want to know whether there’s a selection and what its bounds are.

buffer    a <gtk-text-buffer>
ret     selection bound mark

gtk-text-buffer-get-has-selection (self <gtk-text-buffer>)    [Function]
⇒ (ret bool)

get-has-selection    [Method]
Indicates whether the buffer has some text currently selected.

buffer    a <gtk-text-buffer>
ret     ‘#t’ if there is text selected

Since 2.10
**gtk-text-buffer-place-cursor** *(self <gtk-text-buffer>)*

(where <gtk-text-iter>)

**place-cursor** [Method]

This function moves the "insert" and "selection_bound" marks simultaneously. If you move them to the same place in two steps with **gtk-text-buffer-move-mark**, you will temporarily select a region in between their old and new locations, which can be pretty inefficient since the temporarily-selected region will force stuff to be recalculated. This function moves them as a unit, which can be optimized.

*buffer* a <gtk-text-buffer>

*where* where to put the cursor

**gtk-text-buffer-select-range** *(self <gtk-text-buffer>)*

(ins <gtk-text-iter>) (bound <gtk-text-iter>)

**select-range** [Method]

This function moves the "insert" and "selection_bound" marks simultaneously. If you move them in two steps with **gtk-text-buffer-move-mark**, you will temporarily select a region in between their old and new locations, which can be pretty inefficient since the temporarily-selected region will force stuff to be recalculated. This function moves them as a unit, which can be optimized.

*buffer* a <gtk-text-buffer>

*ins* where to put the "insert" mark

*bound* where to put the "selection_bound" mark

Since 2.4

**gtk-text-buffer-apply-tag** *(self <gtk-text-buffer>)*

(tag <gtk-text-tag>) (start <gtk-text-iter>) (end <gtk-text-iter>)

**apply-tag** [Method]

Emits the "apply_tag" signal on buffer. The default handler for the signal applies tag to the given range. *start* and *end* do not have to be in order.

*buffer* a <gtk-text-buffer>

*tag* a <gtk-text-tag>

*start* one bound of range to be tagged

*end* other bound of range to be tagged

**gtk-text-buffer-remove-tag** *(self <gtk-text-buffer>)*

(tag <gtk-text-tag>) (start <gtk-text-iter>) (end <gtk-text-iter>)

**remove-tag** [Method]

Emits the "remove_tag" signal. The default handler for the signal removes all occurrences of *tag* from the given range. *start* and *end* don’t have to be in order.

*buffer* a <gtk-text-buffer>

*tag* a <gtk-text-tag>

*start* one bound of range to be untagged

*end* other bound of range to be untagged
gtk-text-buffer-apply-tag-by-name (self <gtk-text-buffer>) (name mchars) (start <gtk-text-iter>) (end <gtk-text-iter>)

apply-tag-by-name
Calls gtk-text-tag-table-lookup on the buffer's tag table to get a <gtk-text-tag>, then calls gtk-text-buffer-apply-tag.

buffer a <gtk-text-buffer>
name name of a named <gtk-text-tag>
start one bound of range to be tagged
end other bound of range to be tagged

gtk-text-buffer-remove-tag-by-name (self <gtk-text-buffer>) (name mchars) (start <gtk-text-iter>) (end <gtk-text-iter>)
remove-tag-by-name
Calls gtk-text-tag-table-lookup on the buffer's tag table to get a <gtk-text-tag>, then calls gtk-text-buffer-remove-tag.

buffer a <gtk-text-buffer>
name name of a <gtk-text-tag>
start one bound of range to be untagged
end other bound of range to be untagged

gtk-text-buffer-remove-all-tags (self <gtk-text-buffer>) (start <gtk-text-iter>) (end <gtk-text-iter>)
remove-all-tags
Removes all tags in the range between start and end. Be careful with this function; it could remove tags added in code unrelated to the code you're currently writing. That is, using this function is probably a bad idea if you have two or more unrelated code sections that add tags.

buffer a <gtk-text-buffer>
start one bound of range to be untagged
end other bound of range to be untagged

gtk-text-buffer-get-iter-at-offset (self <gtk-text-buffer>) (char_offset int) ⇒ (ret <gtk-text-iter>)
get-iter-at-offset
Initializes iter to a position char-offset chars from the start of the entire buffer. If char-offset is -1 or greater than the number of characters in the buffer, iter is initialized to the end iterator, the iterator one past the last valid character in the buffer.

buffer a <gtk-text-buffer>
iter iterator to initialize
char-offset char offset from start of buffer, counting from 0, or -1
Chapter 28: GtkTextBuffer

gtk-text-buffer-get-iter-at-line (self <gtk-text-buffer>) ⇒ (ret <gtk-text-iter>)

get-iter-at-line

Initializes iter to the start of the given line.

buffer a <gtk-text-buffer>
iter iterator to initialize
line-number line number counting from 0

gtk-text-buffer-get-iter-at-mark (self <gtk-text-buffer>) ⇒ (ret <gtk-text-iter>)

get-iter-at-mark

Initializes iter with the current position of mark.

buffer a <gtk-text-buffer>
iter iterator to initialize
mark a <gtk-text-mark> in buffer

gtk-text-buffer-get-start-iter (self <gtk-text-buffer>) ⇒ (ret <gtk-text-iter>)

get-start-iter

Initialized iter with the first position in the text buffer. This is the same as using gtk-text-buffer-get-iter-at-offset to get the iter at character offset 0.

buffer a <gtk-text-buffer>
iter iterator to initialize

gtk-text-buffer-get-end-iter (self <gtk-text-buffer>) ⇒ (ret <gtk-text-iter>)

get-end-iter

Initializes iter with the "end iterator," one past the last valid character in the text buffer. If dereferenced with gtk-text-iter-get-char, the end iterator has a character value of 0. The entire buffer lies in the range from the first position in the buffer (call gtk-text-buffer-get-start-iter to get character position 0) to the end iterator.

buffer a <gtk-text-buffer>
iter iterator to initialize

gtk-text-buffer-get-bounds (self <gtk-text-buffer>) ⇒ (start <gtk-text-iter>)(end <gtk-text-iter>)

get-bounds
get-bounds

Retrieves the first and last iterators in the buffer, i.e. the entire buffer lies within the range [start,end).

buffer a <gtk-text-buffer>
**gtk-text-buffer-get-modified**  
`gtk-text-buffer-get-modified (self <gtk-text-buffer>)`  
⇒ `(ret bool)`  
*Method*

Indicates whether the buffer has been modified since the last call to `gtk-text-buffer-set-modified` set the modification flag to `#f`. Used for example to enable a "save" function in a text editor.

```c
buffer a <gtk-text-buffer>
ret 't' if the buffer has been modified
```

**gtk-text-buffer-set-modified**  
`gtk-text-buffer-set-modified (self <gtk-text-buffer>)`  
`(setting bool)`  
*Method*

Used to keep track of whether the buffer has been modified since the last time it was saved. Whenever the buffer is saved to disk, call `gtk_text_buffer_set_modified (buffer, FALSE)`. When the buffer is modified, it will automatically toggled on the modified bit again. When the modified bit flips, the buffer emits a "modified_changed" signal.

```c
buffer a <gtk-text-buffer>
setting modification flag setting
```

**gtk-text-buffer-delete-selection**  
`gtk-text-buffer-delete-selection (self <gtk-text-buffer>)`  
`(interactive bool) (default-editable bool) ⇒ (ret bool)`  
*Method*

Deletes the range between the "insert" and "selection_bound" marks, that is, the currently-selected text. If `interactive` is `t`, the editability of the selection will be considered (users can’t delete uneditable text).

```c
buffer a <gtk-text-buffer>
interactive whether the deletion is caused by user interaction
default-editable whether the buffer is editable by default
ret whether there was a non-empty selection to delete
```

**gtk-text-buffer-paste-clipboard**  
`gtk-text-buffer-paste-clipboard (self <gtk-text-buffer>)`  
`(clipboard <gtk-clipboard>) (override_location <gtk-text-iter>)`  
`(default_editable bool)`  
*Method*

Pastes the contents of a clipboard at the insertion point, or at `override_location`. (Note: pasting is asynchronous, that is, we’ll ask for the paste data and return, and at some point later after the main loop runs, the paste data will be inserted.)

```c
buffer a <gtk-text-buffer>
```
clipboard the <gtk-clipboard> to paste from

override-location
    location to insert pasted text, or ‘#f’ for at the cursor

default-editable
    whether the buffer is editable by default

gtk-text-buffer-copy-clipboard (self <gtk-text-buffer>) [Function]
    (clipboard <gtk-clipboard>) [Method]
    copy-clipboard
        Copies the currently-selected text to a clipboard.
        buffer a <gtk-text-buffer>
        clipboard the <gtk-clipboard> object to copy to.

gtk-text-buffer-cut-clipboard (self <gtk-text-buffer>) [Function]
    (clipboard <gtk-clipboard>) (default-editable bool) [Method]
    cut-clipboard
        Copies the currently-selected text to a clipboard, then deletes said text if it’s editable.
        buffer a <gtk-text-buffer>
        clipboard the <gtk-clipboard> object to cut to.
        default-editable default editability of the buffer

gtk-text-buffer-begin-user-action (self <gtk-text-buffer>) [Function]
    begin-user-action
        Called to indicate that the buffer operations between here and a call to gtk-text-buffer-end-user-action are part of a single user-visible operation. The operations between gtk-text-buffer-begin-user-action and gtk-text-buffer-end-user-action can then be grouped when creating an undo stack. <gtk-text-buffer> maintains a count of calls to gtk-text-buffer-begin-user-action that have not been closed with a call to gtk-text-buffer-end-user-action, and emits the "begin_user_action" and "end_user_action" signals only for the outermost pair of calls. This allows you to build user actions from other user actions.
        The "interactive" buffer mutation functions, such as gtk-text-buffer-insert-interactive, automatically call begin/end user action around the buffer operations they perform, so there’s no need to add extra calls if you user action consists solely of a single call to one of those functions.
        buffer a <gtk-text-buffer>

gtk-text-buffer-end-user-action (self <gtk-text-buffer>) [Function]
    end-user-action
        Should be paired with a call to gtk-text-buffer-begin-user-action. See that function for a full explanation.
        buffer a <gtk-text-buffer>
29 GtkTextTag

A tag that can be applied to text in a

29.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

Tags should be in the `<gtk-text-tag-table>` for a given `<gtk-text-buffer>` before using them with that buffer.

`gtk-text-buffer-create-tag` is the best way to create tags. See for numerous examples.

The "invisible" property was not implemented for GTK+ 2.0; it's planned to be implemented in future releases.

29.2 Usage

```xml
<gtk-text-tag> [Class]
  Derives from <gobject>.
  This class defines the following slots:
  name       Name used to refer to the text tag. NULL for anonymous tags
  background Background color as a string
  foreground Foreground color as a string
  background-gdk Background color as a (possibly unallocated) GdkColor
  foreground-gdk Foreground color as a (possibly unallocated) GdkColor
  background-stipple Bitmap to use as a mask when drawing the text background
  foreground-stipple Bitmap to use as a mask when drawing the text foreground
  font       Font description as a string, e.g. "Sans Italic 12"
  font-desc  Font description as a PangoFontDescription struct
  family     Name of the font family, e.g. Sans, Helvetica, Times, Monospace
  style      Font style as a PangoStyle, e.g. PANGO_STYLE_ITALIC
  variant    Font variant as a PangoVariant, e.g. PANGO_VARIANT_SMALL_CAPS
```

weight  Font weight as an integer, see predefined values in PangoWeight; for example, PANGO_WEIGHT_BOLD
stretch  Font stretch as a PangoStretch, e.g. PANGO_STRETCH_CONDENSED
size  Font size in Pango units
size-points  Font size in points
scale  Font size as a scale factor relative to the default font size. This properly adapts to theme changes etc. so is recommended. Pango predefines some scales such as PANGO_SCALE_X_LARGE
pixels-above-lines  Pixels of blank space above paragraphs
pixels-below-lines  Pixels of blank space below paragraphs
pixels-inside-wrap  Pixels of blank space between wrapped lines in a paragraph
editable  Whether the text can be modified by the user
wrap-mode  Whether to wrap lines never, at word boundaries, or at character boundaries
justification  Left, right, or center justification
direction  Text direction, e.g. right-to-left or left-to-right
left-margin  Width of the left margin in pixels
indent  Amount to indent the paragraph, in pixels
 strikethrough  Whether to strike through the text
right-margin  Width of the right margin in pixels
underline  Style of underline for this text
rise  Offset of text above the baseline (below the baseline if rise is negative) in Pango units
background-full-height  Whether the background color fills the entire line height or only the height of the tagged characters
language  The language this text is in, as an ISO code. Pango can use this as a hint when rendering the text. If not set, an appropriate default will be used.
tabs          Custom tabs for this text
invisible     Whether this text is hidden.

paragraph-background
Paragraph background color as a string
paragraph-background-gdk
Paragraph background color as a (possibly unallocated) GdkColor

accumulative-margin
Whether left and right margins accumulate.

background-set
Whether this tag affects the background color

foreground-set
Whether this tag affects the foreground color

background-stipple-set
Whether this tag affects the background stipple

foreground-stipple-set
Whether this tag affects the foreground stipple

family-set
Whether this tag affects the font family

style-set
Whether this tag affects the font style

variant-set
Whether this tag affects the font variant

weight-set
Whether this tag affects the font weight

stretch-set
Whether this tag affects the font stretch

size-set
Whether this tag affects the font size

scale-set
Whether this tag scales the font size by a factor

pixels-above-lines-set
Whether this tag affects the number of pixels above lines

pixels-below-lines-set
Whether this tag affects the number of pixels above lines

pixels-inside-wrap-set
Whether this tag affects the number of pixels between wrapped lines

editable-set
Whether this tag affects text editability
wrap-mode-set
Whether this tag affects line wrap mode

justification-set
Whether this tag affects paragraph justification

left-margin-set
Whether this tag affects the left margin

indent-set
Whether this tag affects indentation

strikethrough-set
Whether this tag affects strikethrough

right-margin-set
Whether this tag affects the right margin

underline-set
Whether this tag affects underlining

rise-set
Whether this tag affects the rise

background-full-height-set
Whether this tag affects background height

language-set
Whether this tag affects the language the text is rendered as

tabs-set
Whether this tag affects tabs

invisible-set
Whether this tag affects text visibility

paragraph-background-set
Whether this tag affects the paragraph background color

event (arg0 <gobject>) (arg1 <gdk-event>)  [Signal on <gtk-text-tag>]
                          (arg2 <gtk-text-iter>) ⇒ <gboolean>

<gtk-text-attributes>          [Class]
Derives from <gboxed>.
This class defines no direct slots.

gtk-text-tag-new (name mchars) ⇒ (ret <gtk-text-tag>)            [Function]
Creates a <gtk-text-tag>. Configure the tag using object arguments, i.e. using
g-object-set.

        name   tag name, or ‘#f’
        ret    a new <gtk-text-tag>

gtk-text-tag-get-priority (self <gtk-text-tag>) ⇒ (ret int)       [Function]
get-priority
Get the tag priority.

        tag     a <gtk-text-tag>
        ret    The tag’s priority.
**gtk-text-tag-set-priority** (*self <gtk-text-tag>* (*priority* int))  
Sets the priority of a `<gtk-text-tag>`. Valid priorities are start at 0 and go to one less than `gtk-text-tag-table-get-size`. Each tag in a table has a unique priority; setting the priority of one tag shifts the priorities of all the other tags in the table to maintain a unique priority for each tag. Higher priority tags "win" if two tags both set the same text attribute. When adding a tag to a tag table, it will be assigned the highest priority in the table by default; so normally the precedence of a set of tags is the order in which they were added to the table, or created with `gtk-text-buffer-create-tag`, which adds the tag to the buffer’s table automatically.

- **tag**  
a `<gtk-text-tag>`
- **priority**  
the new priority

**gtk-text-tag-event** (*self <gtk-text-tag>* (*event-object* <gobject>))  
* (event <gdk-event>* (*iter* <gtk-text-iter>)) ⇒ (*ret* bool)
Emits the "event" signal on the `<gtk-text-tag>`.

- **tag**  
a `<gtk-text-tag>`
- **event-object**  
object that received the event, such as a widget
- **event**  
the event
- **iter**  
location where the event was received
- **ret**  
result of signal emission (whether the event was handled)

**gtk-text-attributes-new** ⇒ (*ret* <gtk-text-attributes>)
Creates a `<gtk-text-attributes>`, which describes a set of properties on some text.

- **ret**  
a new `<gtk-text-attributes>`

**gtk-text-attributes-copy** (*self <gtk-text-attributes>*)
⇒ (*ret* <gtk-text-attributes>)
Copies `src` and returns a new `<gtk-text-attributes>`.

- **src**  
a `<gtk-text-attributes>` to be copied
- **ret**  
a copy of `src`

**gtk-text-attributes-copy-values** (*self <gtk-text-attributes>*)
* (dest <gtk-text-attributes>)
Copies the values from `src` to `dest` so that `dest` has the same values as `src`. Frees existing values in `dest`.

- **src**  
a `<gtk-text-attributes>`
- **dest**  
another `<gtk-text-attributes>`
30 GtkTextTagTable

Collection of tags that can be used together

30.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

30.2 Usage

<gtk-text-tag-table> [Class]

  Derives from <gobject>.
  This class defines no direct slots.

  tag-changed (arg0 <gtk-text-tag>) [Signal on <gtk-text-tag-table>]
    (arg1 <gboolean>)
  tag-added (arg0 <gtk-text-tag>) [Signal on <gtk-text-tag-table>]
  tag-removed (arg0 <gtk-text-tag>) [Signal on <gtk-text-tag-table>]

  gtk-text-tag-table-new ⇒ (ret <gtk-text-tag-table>) [Function]
    Creates a new <gtk-text-tag-table>. The table contains no tags by default.
    ret a new <gtk-text-tag-table>

  gtk-text-tag-table-add (self <gtk-text-tag-table>) [Function]
    (tag <gtk-text-tag>)
    Add a tag to the table. The tag is assigned the highest priority in the table.
    tag must not be in a tag table already, and may not have the same name as an already-added tag.
    table a <gtk-text-tag-table>
    tag a <gtk-text-tag>

  gtk-text-tag-table-remove (self <gtk-text-tag-table>) [Function]
    (tag <gtk-text-tag>)
    Remove a tag from the table. This will remove the table’s reference to the tag, so be careful - the tag will end up destroyed if you don’t have a reference to it.
    table a <gtk-text-tag-table>
    tag a <gtk-text-tag>

  gtk-text-tag-table-lookup (self <gtk-text-tag-table>) [Function]
    (name mchars) ⇒ (ret <gtk-text-tag>)
    Look up a named tag.
    lookup

    ret a new <gtk-text-tag-table>

    add

    table

    tag

    remove

    lookup
Chapter 30: GtkTextTagTable

\[
\text{
\begin{array}{ll}
\text{name} & \text{name of a tag} \\
\text{ret} & \text{The tag, or ‘#f’ if none by that name is in the table.}
\end{array}
\]
\]

\text{gtk-text-tag-table-get-size (self \text{<gtk-text-tag-table>})} \quad \text{[Function]}
\[
\Rightarrow (\text{ret int})
\]
get-size
\[
\quad \text{Returns the size of the table (number of tags)}
\]

\text{table} \quad \text{a \text{<gtk-text-tag-table>}}

\text{ret} \quad \text{number of tags in \text{table}}
31 GtkTextView

Widget that displays a

31.1 Overview

You may wish to begin by reading the text widget conceptual overview which gives an overview of all the objects and data types related to the text widget and how they work together.

31.2 Usage

<gtk-text-view>  
   Derives from <gtk-container>.  
   This class defines the following slots:
   
   pixels-above-lines  
       Pixels of blank space above paragraphs
   
   pixels-below-lines  
       Pixels of blank space below paragraphs
   
   pixels-inside-wrap  
       Pixels of blank space between wrapped lines in a paragraph
   
   editable  
       Whether the text can be modified by the user
   
   wrap-mode  
       Whether to wrap lines never, at word boundaries, or at character boundaries
   
   justification  
       Left, right, or center justification
   
   left-margin  
       Width of the left margin in pixels
   
   right-margin  
       Width of the right margin in pixels
   
   indent  
       Amount to indent the paragraph, in pixels
   
   tabs  
       Custom tabs for this text
   
   cursor-visible  
       If the insertion cursor is shown
   
   buffer  
       The buffer which is displayed
   
   overwrite  
       Whether entered text overwrites existing contents
   
   accepts-tab  
       Whether Tab will result in a tab character being entered
move-cursor (arg0 <gtk-movement-step>)  [Signal on <gtk-text-view>]
    (arg1 <gint>)(arg2 <gboolean>)

The ::move-cursor signal is a keybinding signal which gets emitted when the user
initiates a cursor movement.

Applications should not connect to it, but may emit it with g-signal-emit-by-name
if they need to control scrolling programmatically.

copy-clipboard  [Signal on <gtk-text-view>]
populate-popup (arg0 <gtk-menu>)  [Signal on <gtk-text-view>]
insert-at-cursor (arg0 <gchararray>)  [Signal on <gtk-text-view>]
delete-from-cursor (arg0 <gtk-delete-type>)  [Signal on <gtk-text-view>]
    (arg1 <gint>)

backspace  [Signal on <gtk-text-view>]
cut-clipboard  [Signal on <gtk-text-view>]
paste-clipboard  [Signal on <gtk-text-view>]
toggle-overwrite  [Signal on <gtk-text-view>]
set-scroll-adjustments  [Signal on <gtk-text-view>]
    (arg0 <gtk-adjustment>)(arg1 <gtk-adjustment>)
select-all (arg0 <gboolean>)  [Signal on <gtk-text-view>]
page-horizontally (arg0 <gint>)  [Signal on <gtk-text-view>]
    (arg1 <gboolean>)
move-viewport (arg0 <gtk-scroll-step>)  [Signal on <gtk-text-view>]
    (arg1 <gint>)

set-anchor  [Signal on <gtk-text-view>]
toggle-cursor-visible  [Signal on <gtk-text-view>]

<gtk-text-child-anchor>  [Class]

Derives from <gobject>.

This class defines no direct slots.

gtk-text-view-new-with-buffer (buffer <gtk-text-buffer>)  [Function]
    ⇒ (ret <gtk-widget>)

Creates a new <gtk-text-view> widget displaying the buffer buffer. One buffer can
be shared among many widgets. buffer may be NULL to create a default buffer, in
which case this function is equivalent to gtk-text-view-new. The text view adds its
own reference count to the buffer; it does not take over an existing reference.

buffer a <gtk-text-buffer>

ret a new <gtk-text-view>. 
Chapter 31: GtkTextView

```plaintext
gtk-text-view-set-buffer (self <gtk-text-view>)
  (buffer <gtk-text-buffer>)
set-buffer
Sets buffer as the buffer being displayed by text-view. The previous buffer displayed
by the text view is unreferenced, and a reference is added to buffer. If you owned a
reference to buffer before passing it to this function, you must remove that reference
yourself; <gtk-text-view> will not "adopt" it.

text-view a <gtk-text-view>
buffer a <gtk-text-buffer>
```

```plaintext
gtk-text-view-get-buffer (self <gtk-text-view>)
⇒ (ret <gtk-text-buffer>)
get-buffer
Returns the <gtk-text-buffer> being displayed by this text view. The reference
count on the buffer is not incremented; the caller of this function won't own a new
reference.

text-view a <gtk-text-view>
ret a <gtk-text-buffer>
```

```plaintext
gtk-text-view-scroll-to-mark (self <gtk-text-view>)
  (mark <gtk-text-mark>) (within_margin double) (use_align bool)
  (xalign double) (yalign double)
scroll-to-mark
Scrolls text-view so that mark is on the screen in the position indicated by xalign
and yalign. An alignment of 0.0 indicates left or top, 1.0 indicates right or bottom,
0.5 means center. If use-align is '#f', the text scrolls the minimal distance to get the
mark onscreen, possibly not scrolling at all. The effective screen for purposes of this
function is reduced by a margin of size within-margin.

text-view a <gtk-text-view>
mark a <gtk-text-mark>
within-margin
  margin as a [0.0,0.5) fraction of screen size
use-align whether to use alignment arguments (if '#f', just get the mark onscreen)
xalign horizontal alignment of mark within visible area.
yalign vertical alignment of mark within visible area
```

```plaintext
gtk-text-view-scroll-to-iter (self <gtk-text-view>)
  (iter <gtk-text-iter>) (within_margin double) (use_align bool)
  (xalign double) (yalign double) ⇒ (ret bool)
scroll-to-iter
Scrolls text-view so that iter is on the screen in the position indicated by xalign and
yalign. An alignment of 0.0 indicates left or top, 1.0 indicates right or bottom, 0.5
means center. If use-align is '#f', the text scrolls the minimal distance to get the
mark onscreen, possibly not scrolling at all. The effective screen for purposes of this
function is reduced by a margin of size within-margin. NOTE: This function uses the
currently-computed height of the lines in the text buffer. Note that line heights are
computed in an idle handler; so this function may not have the desired effect if it’s
called before the height computations. To avoid oddness, consider using gtk-text-
view-scroll-to-mark which saves a point to be scrolled to after line validation.

```glib
gtk-text-view-scroll-mark-onscreen (self <gtk-text-view>)
(mark <gtk-text-mark>)
```

**scroll-mark-onscreen**
Scrolls text-view the minimum distance such that mark is contained within the visible
area of the widget.

```glib
gtk-text-view-move-mark-onscreen (self <gtk-text-view>)
(mark <gtk-text-mark>) ⇒ (ret bool)
```

**move-mark-onscreen**
Moves a mark within the buffer so that it’s located within the currently-visible text
area.

```glib
gtk-text-view-place-cursor-onscreen (self <gtk-text-view>)
⇒ (ret bool)
```

**place-cursor-onscreen**
Moves the cursor to the currently visible region of the buffer, it it isn’t there already.

```glib
gtk-text-view-get-visible-rect (self <gtk-text-view>)
(visible_rect <gdk-rectangle>)
```

**get-visible-rect**
Fills visible-rect with the currently-visible region of the buffer, in buffer coordinates.
Convert to window coordinates with gtk-text-view-buffer-to-window-coords.
text-view a <gtk-text-view>

visible-rect rectangle to fill

gtk-text-view-get-iter-location (self <gtk-text-view>) (iter <gtk-text-iter>) (location <gdk-rectangle>) [Function]

get-iter-location [Method]

Gets a rectangle which roughly contains the character at iter. The rectangle position is in buffer coordinates; use gtk-text-view-buffer-to-window-coords to convert these coordinates to coordinates for one of the windows in the text view.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
location bounds of the character at iter

gtk-text-view-get-line-at-y (self <gtk-text-view>) (target_iter <gtk-text-iter>) (y int) ⇒ (line_top int) [Function]

get-line-at-y [Method]

Gets the <gtk-text-iter> at the start of the line containing the coordinate y. y is in buffer coordinates, convert from window coordinates with gtk-text-view-window-to-buffer-coords. If non-‘#f’, line-top will be filled with the coordinate of the top edge of the line.

text-view a <gtk-text-view>
target-iter a <gtk-text-iter>
y a y coordinate
line-top return location for top coordinate of the line

gtk-text-view-get-line-yrange (self <gtk-text-view>) (iter <gtk-text-iter>) ⇒ (y int) (height int) [Function]

get-line-yrange [Method]

Gets the y coordinate of the top of the line containing iter, and the height of the line. The coordinate is a buffer coordinate; convert to window coordinates with gtk-text-view-window-to-buffer-coords.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
y return location for a y coordinate
height return location for a height

gtk-text-view-get-iter-at-location (self <gtk-text-view>) (iter <gtk-text-iter>) (x int) (y int) [Function]

get-iter-at-location [Method]

Retrieves the iterator at buffer coordinates x and y. Buffer coordinates are coordinates for the entire buffer, not just the currently-displayed portion. If you have coordinates from an event, you have to convert those to buffer coordinates with gtk-text-view-window-to-buffer-coords.
Chapter 31: GtKTextView

```plaintext
text-view a <gtk-text-view>
iter a <gtk-text-iter>
x x position, in buffer coordinates
y y position, in buffer coordinates

gtk-text-view-get-window (self <gtk-text-view>) (win <gtk-text-window-type>) ⇒ (ret <gdk-window>)  [Function]
get-window [Method]
Retrieves the <gdk-window> corresponding to an area of the text view; possible windows include the overall widget window, child windows on the left, right, top, bottom, and the window that displays the text buffer. Windows are ‘#f’ and nonexistent if their width or height is 0, and are nonexistent before the widget has been realized.

text-view a <gtk-text-view>
win window to get
ret a <gdk-window>, or ‘#f’

gtk-text-view-get-window-type (self <gtk-text-view>) (window <gdk-window>) ⇒ (ret <gtk-text-window-type>)  [Function]
get-window-type [Method]
Usually used to find out which window an event corresponds to. If you connect to an event signal on text-view, this function should be called on ‘event->window’ to see which window it was.

text-view a <gtk-text-view>
window a window type
ret the window type.

gtk-text-view-forward-display-line (self <gtk-text-view>) (iter <gtk-text-iter>) ⇒ (ret bool)  [Function]
forward-display-line [Method]
Moves the given iter forward by one display (wrapped) line. A display line is different from a paragraph. Paragraphs are separated by newlines or other paragraph separator characters. Display lines are created by line-wrapping a paragraph. If wrapping is turned off, display lines and paragraphs will be the same. Display lines are divided differently for each view, since they depend on the view’s width; paragraphs are the same in all views, since they depend on the contents of the <gtk-text-buffer>.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
ret ‘#t’ if iter was moved and is not on the end iterator

gtk-text-view-backward-display-line (self <gtk-text-view>) (iter <gtk-text-iter>) ⇒ (ret bool)  [Function]
backward-display-line [Method]
Moves the given iter backward by one display (wrapped) line. A display line is different from a paragraph. Paragraphs are separated by newlines or other paragraph
separator characters. Display lines are created by line-wrapping a paragraph. If
wrapping is turned off, display lines and paragraphs will be the same. Display lines are
divided differently for each view, since they depend on the view’s width; paragraphs
are the same in all views, since they depend on the contents of the <gtk-text-
buffer>.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
ret ‘#t’ if iter was moved and is not on the end iterator

gtk-text-view-starts-display-line (self <gtk-text-view>) [Function]
(iter <gtk-text-iter>) ⇒ (ret bool)
starts-display-line [Method]
Determines whether iter is at the start of a display line. See gtk-text-view-
forward-display-line for an explanation of display lines vs. paragraphs.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
ret ‘#t’ if iter begins a wrapped line

gtk-text-view-move-Visually (self <gtk-text-view>) [Function]
(iter <gtk-text-iter>) (count int) ⇒ (ret bool)
move-visually [Method]
Move the iterator a given number of characters visually, treating it as the strong
cursor position. If count is positive, then the new strong cursor position will be count
positions to the right of the old cursor position. If count is negative then the new
strong cursor position will be count positions to the left of the old cursor position.
In the presence of bidirection text, the correspondence between logical and visual
order will depend on the direction of the current run, and there may be jumps when
the cursor is moved off of the end of a run.

text-view a <gtk-text-view>
iter a <gtk-text-iter>
count number of characters to move (negative moves left, positive moves right)
ret ‘#t’ if iter moved and is not on the end iterator

gtk-text-view-add-child-at-anchor (self <gtk-text-view>) [Function]
(child <gtk-widget>) (anchor <gtk-text-child-anchor>)
add-child-at-anchor [Method]
Adds a child widget in the text buffer, at the given anchor.

text-view a <gtk-text-view>
child a <gtk-widget>
anchor a <gtk-text-child-anchor> in the <gtk-text-buffer> for text-view
Chapter 31: GtkTextView

gtk-text-child-anchor-new ⇒ (ret <gtk-text-child-anchor>)  [Function]
 Creates a new <gtk-text-child-anchor>. Usually you would then insert it into a
<gtk-text-buffer> with gtk-text-buffer-insert-child-anchor. To perform the
creation and insertion in one step, use the convenience function gtk-text-buffer-
create-child-anchor.

ret a new <gtk-text-child-anchor>

gtk-text-child-anchor-get-widgets  [Function]
 (self <gtk-text-child-anchor>) ⇒ (ret glist-of)
get-widgets  [Method]
 Gets a list of all widgets anchored at this child anchor. The returned list should be
freed with g-list-free.

anchor a <gtk-text-child-anchor>
ret list of widgets anchored at anchor

gtk-text-child-anchor-get-deleted  [Function]
 (self <gtk-text-child-anchor>) ⇒ (ret bool)
get-deleted  [Method]
 Determines whether a child anchor has been deleted from the buffer. Keep in mind
that the child anchor will be unreferenced when removed from the buffer, so you
need to hold your own reference (with g-object-ref) if you plan to use this function
&n#x2014; otherwise all deleted child anchors will also be finalized.

anchor a <gtk-text-child-anchor>
ret 't' if the child anchor has been deleted from its buffer

gtk-text-view-add-child-in-window (self <gtk-text-view>)  [Function]
 (child <gtk-widget>) (which-window <gtk-text-window-type>)
 (xpos int) (ypos int)
add-child-in-window  [Method]
 Adds a child at fixed coordinates in one of the text widget’s windows. The window
must have nonzero size (see gtk-text-view-set-border-window-size). Note that
the child coordinates are given relative to the <gdk-window> in question, and that
these coordinates have no sane relationship to scrolling. When placing a child in
<gtk-text-window-widget>, scrolling is irrelevant, the child floats above all scroll-
able areas. But when placing a child in one of the scrollable windows (border win-
doors or text window), you’ll need to compute the child’s correct position in buffer
coordinates any time scrolling occurs or buffer changes occur, and then call gtk-text-
view-move-child to update the child’s position. Unfortunately there’s no good way
to detect that scrolling has occurred, using the current API; a possible hack would
be to update all child positions when the scroll adjustments change or the text buffer
changes. See bug 64518 on bugzilla.gnome.org for status of fixing this issue.

text-view a <gtk-text-view>
child a <gtk-widget>
which-window which window the child should appear in
xpos  X position of child in window coordinates
ypos  Y position of child in window coordinates

gtk-text-view-move-child (self <gtk-text-view>) (child <gtk-widget>) (xpos int) (ypos int)

move-child
Updates the position of a child, as for gtk-text-view-add-child-in-window.

gtk-text-view-set-wrap-mode (self <gtk-text-view>) (wrap_mode <gtk-wrap-mode>)

set-wrap-mode
Sets the line wrapping for the view.

gtk-text-view-get-wrap-mode (self <gtk-text-view>) ⇒ (ret <gtk-wrap-mode>)

get-wrap-mode
Gets the line wrapping for the view.

gtk-text-view-set-editable (self <gtk-text-view>) (setting bool)

set-editable
Sets the default editability of the <gtk-text-view>. You can override this default setting with tags in the buffer, using the "editable" attribute of tags.

gtk-text-view-get-editable (self <gtk-text-view>) ⇒ (ret bool)

get-editable
Returns the default editability of the <gtk-text-view>. Tags in the buffer may override this setting for some ranges of text.
**gtk-text-view-set-cursor-visible** (*self* <gtk-text-view>)  
*function*  

\[\text{set-cursor-visible}\]  
Method  

Toggles whether the insertion point is displayed. A buffer with no editable text probably shouldn't have a visible cursor, so you may want to turn the cursor off.

\[\text{text-view \ a \ <gtk-text-view>}\]  
\[\text{setting} \ \text{whether to show the insertion cursor}\]

**gtk-text-view-get-cursor-visible** (*self* <gtk-text-view>)  
*function*  

\[\text{get-cursor-visible}\]  
Method  

Find out whether the cursor is being displayed.

\[\text{text-view \ a \ <gtk-text-view>}\]  
\[\text{ret} \ \text{whether the insertion mark is visible}\]

**gtk-text-view-set-overwrite** (*self* <gtk-text-view>)  
*function*  

\[\text{set-overwrite}\]  
Method  

Changes the <gtk-text-view> overwrite mode.  

\[\text{text-view \ a \ <gtk-text-view>}\]  
\[\text{overwrite \ ‘#t’ to turn on overwrite mode, ‘#f’ to turn it off}\]

Since 2.4

**gtk-text-view-get-overwrite** (*self* <gtk-text-view>)  
*function*  

\[\text{get-overwrite}\]  
Method  

Returns whether the <gtk-text-view> is in overwrite mode or not.

\[\text{text-view \ a \ <gtk-text-view>}\]  
\[\text{ret} \ \text{whether text-view is in overwrite mode or not.}\]

Since 2.4

**gtk-text-view-set-justification** (*self* <gtk-text-view>)  
*function*  

\[\text{set-justification}\]  
Method  

Sets the default justification of text in text-view. Tags in the view's buffer may override the default.

\[\text{text-view \ a \ <gtk-text-view>}\]  
\[\text{justification}\]

\[\text{justification}\]

**gtk-text-view-get-justification** (*self* <gtk-text-view>)  
*function*  

\[\text{get-justification}\]  
Method  

Gets the default justification of paragraphs in text-view. Tags in the buffer may override the default.
text-view a <gtk-text-view>
ret default justification

gtk-text-view-set-left-margin (self <gtk-text-view>) [Function]
(\texttt{left\_margin} \texttt{int})
set-left-margin [Method]
Sets the default left margin for text in \textit{text-view}. Tags in the buffer may override the default.

text-view a <gtk-text-view>
left-margin left margin in pixels

gtk-text-view-get-left-margin (self <gtk-text-view>) [Function]
⇒ (ret int)
get-left-margin [Method]
Gets the default left margin size of paragraphs in the \textit{text-view}. Tags in the buffer may override the default.

text-view a <gtk-text-view>
ret left margin in pixels

gtk-text-view-set-right-margin (self <gtk-text-view>) [Function]
(\texttt{right\_margin} \texttt{int})
set-right-margin [Method]
Sets the default right margin for text in the text view. Tags in the buffer may override the default.

text-view a <gtk-text-view>
right-margin right margin in pixels

gtk-text-view-get-right-margin (self <gtk-text-view>) [Function]
⇒ (ret int)
get-right-margin [Method]
Gets the default right margin for text in \textit{text-view}. Tags in the buffer may override the default.

text-view a <gtk-text-view>
ret right margin in pixels

gtk-text-view-set-indent (self <gtk-text-view>) (indent int) [Function]
set-indent [Method]
Sets the default indentation for paragraphs in \textit{text-view}. Tags in the buffer may override the default.

text-view a <gtk-text-view>
indent indentation in pixels

```python
gtk-text-view-get-indent (self <gtk-text-view>) ⇒ (ret int)  [Function]
get-indent  [Method]

Gets the default indentation of paragraphs in text-view. Tags in the view’s buffer may override the default. The indentation may be negative.

  text-view  a <gtk-text-view>
  ret  number of pixels of indentation

gtk-text-view-set-tabs (self <gtk-text-view>)  [Function]
  (tabs <pango-tab-array>)
set-tabs  [Method]

Sets the default tab stops for paragraphs in text-view. Tags in the buffer may override the default.

  text-view  a <gtk-text-view>
  tabs  tabs as a <pango-tab-array>

gtk-text-view-get-tabs (self <gtk-text-view>)  [Function]
  ⇒ (ret <pango-tab-array>)
get-tabs  [Method]

Gets the default tabs for text-view. Tags in the buffer may override the defaults. The returned array will be ‘#f’ if "standard" (8-space) tabs are used. Free the return value with pango-tab-array-free.

  text-view  a <gtk-text-view>
  ret  copy of default tab array, or ‘#f’ if "standard" tabs are used; must be freed with pango-tab-array-free.

gtk-text-view-set-accepts-tab (self <gtk-text-view>)  [Function]
  (accepts_tab bool)
set-accepts-tab  [Method]

Sets the behavior of the text widget when the Tab key is pressed. If accepts-tab is ‘#t’ a tab character is inserted. If accepts-tab is ‘#f’ the keyboard focus is moved to the next widget in the focus chain.

  text-view  A <gtk-text-view>
  accepts-tab

  ‘#t’ if pressing the Tab key should insert a tab character, ‘#f’, if pressing the Tab key should move the keyboard focus.

  Since 2.4

gtk-text-view-get-accepts-tab (self <gtk-text-view>)  [Function]
  ⇒ (ret bool)
get-accepts-tab  [Method]

Returns whether pressing the Tab key inserts a tab characters. gtk-text-view-set-accepts-tab.

  text-view  A <gtk-text-view>
```
ret  '#t' if pressing the Tab key inserts a tab character, '#f' if pressing the Tab key moves the keyboard focus.

Since 2.4
32 GtkTreeModel

The tree interface used by

32.1 Overview

The <gtk-tree-model> interface defines a generic tree interface for use by the <gtk-tree-view> widget. It is an abstract interface, and is designed to be usable with any appropriate data structure. The programmer just has to implement this interface on their own data type for it to be viewable by a <gtk-tree-view> widget.

The model is represented as a hierarchical tree of strongly-typed, columned data. In other words, the model can be seen as a tree where every node has different values depending on which column is being queried. The type of data found in a column is determined by using the GType system (ie. <g-type-int>, <gtk-type-button>, <g-type-pointer>, etc.). The types are homogeneous per column across all nodes. It is important to note that this interface only provides a way of examining a model and observing changes. The implementation of each individual model decides how and if changes are made.

In order to make life simpler for programmers who do not need to write their own specialized model, two generic models are provided — the <gtk-tree-store> and the <gtk-list-store>. To use these, the developer simply pushes data into these models as necessary. These models provide the data structure as well as all appropriate tree interfaces. As a result, implementing drag and drop, sorting, and storing data is trivial. For the vast majority of trees and lists, these two models are sufficient.

Models are accessed on a node/column level of granularity. One can query for the value of a model at a certain node and a certain column on that node. There are two structures used to reference a particular node in a model. They are the <gtk-tree-path> and the <gtk-tree-iter>. Most of the interface consists of operations on a <gtk-tree-iter>.

Here, is short for

A path is essentially a potential node. It is a location on a model that may or may not actually correspond to a node on a specific model. The <gtk-tree-path> struct can be converted into either an array of unsigned integers or a string. The string form is a list of numbers separated by a colon. Each number refers to the offset at that level. Thus, the path refers to the root node and the path refers to the fifth child of the third node.

By contrast, a <gtk-tree-iter> is a reference to a specific node on a specific model. It is a generic struct with an integer and three generic pointers. These are filled in by the model in a model-specific way. One can convert a path to an iterator by calling gtk-tree-model-get-iter. These iterators are the primary way of accessing a model and are similar to the iterators used by <gtk-text-buffer>. They are generally statically allocated on the stack and only used for a short time. The model interface defines a set of operations using them for navigating the model.

It is expected that models fill in the iterator with private data. For example, the <gtk-list-store> model, which is internally a simple linked list, stores a list node in one of the pointers. The <gtk-tree-model-sort> stores an array and an offset in two of the pointers. Additionally, there is an integer field. This field is generally filled with a unique stamp per model. This stamp is for catching errors resulting from using invalid iterators with a model.
Chapter 32: GtkTreeModel

The lifecycle of an iterator can be a little confusing at first. Iterators are expected to always be valid for as long as the model is unchanged (and doesn’t emit a signal). The model is considered to own all outstanding iterators and nothing needs to be done to free them from the user’s point of view. Additionally, some models guarantee that an iterator is valid for as long as the node it refers to is valid (most notably the <gtk-tree-store> and <gtk-list-store>). Although generally uninteresting, as one always has to allow for the case where iterators do not persist beyond a signal, some very important performance enhancements were made in the sort model. As a result, the <gtk-tree-model-iter-persist> flag was added to indicate this behavior.

To help show some common operation of a model, some examples are provided. The first example shows three ways of getting the iter at the location . While the first method shown is easier, the second is much more common, as you often get paths from callbacks.

```c
/* Three ways of getting the iter pointing to the location */
{
    GtkTreePath *path;
    GtkTreeIter iter;
    GtkTreeIter parent_iter;

    /* get the iterator from a string */
    gtk_tree_model_get_iter_from_string (model, &iter, "3:2:5");

    /* get the iterator from a path */
    path = gtk_tree_path_new_from_string ("3:2:5");
    gtk_tree_model_get_iter (model, &iter, path);
    gtk_tree_path_free (path);

    /* walk the tree to find the iterator */
    gtk_tree_model_iter_nth_child (model, &iter, NULL, 3);
    parent_iter = iter;
    gtk_tree_model_iter_nth_child (model, &iter, &parent_iter, 2);
    parent_iter = iter;
    gtk_tree_model_iter_nth_child (model, &iter, &parent_iter, 5);
}
```

This second example shows a quick way of iterating through a list and getting a string and an integer from each row. The populate-model function used below is not shown, as it is specific to the <gtk-list-store>. For information on how to write such a function, see the <gtk-list-store> documentation.

```c
enum
{
    STRING_COLUMN,
    INT_COLUMN,
    N_COLUMNS
}```
Chapter 32: GtkTreeModel

32.2 Usage

<gtk-tree-model> [Class]

Derives from <ginterface>.

This class defines no direct slots.
row-changed (arg0 <gtk-tree-path>)  [Signal on <gtk-tree-model>]
               (arg1 <gtk-tree-iter>)
   This signal is emitted when a row in the model has changed.

row-inserted (arg0 <gtk-tree-path>)  [Signal on <gtk-tree-model>]
               (arg1 <gtk-tree-iter>)
   This signal is emitted when a new row has been inserted in the model.
   Note that the row may still be empty at this point, since it is a common pattern to
   first insert an empty row, and then fill it with the desired values.

row-has-child-toggled (arg0 <gtk-tree-path>)  [Signal on <gtk-tree-model>]
               (arg1 <gtk-tree-iter>)
   This signal is emitted when a row has gotten the first child row or lost its last child
   row.

row-deleted (arg0 <gtk-tree-path>)  [Signal on <gtk-tree-model>]
   This signal is emitted when a row has been deleted.
   Note that no iterator is passed to the signal handler, since the row is already deleted.
   Implementations of GtkTreeModel must emit row-deleted before removing the node
   from its internal data structures. This is because models and views which access and
   monitor this model might have references on the node which need to be released in
   the row-deleted handler.

rows-reordered (arg0 <gtk-tree-path>)  [Signal on <gtk-tree-model>]
               (arg1 <gtk-tree-iter>) (arg2 <gpointer>)
   This signal is emitted when the children of a node in the <gtk-tree-model> have
   been reordered.
   Note that this signal is not emitted when rows are reordered by DND, since this is
   implemented by removing and then reinserting the row.

<gtk-tree-iter>  [Class]
   Derives from <gboxed>.
   This class defines no direct slots.

<gtk-tree-path>  [Class]
   Derives from <gboxed>.
   This class defines no direct slots.

<gtk-tree-row-reference>  [Class]
   Derives from <gboxed>.
   This class defines no direct slots.

gtk-tree-path-new-from-string (path mchars) (path mchars)  [Function]
               ⇒ (ret <gtk-tree-path>)
   Creates a new <gtk-tree-path> initialized to path. path is expected to be a colon
   separated list of numbers. For example, the string "10:4:0" would create a path of
   depth 3 pointing to the 11th child of the root node, the 5th child of that 11th child,
   and the 1st child of that 5th child. If an invalid path string is passed in, ‘#f’ is
   returned.
Chapter 32: GtkTreeModel

path  The string representation of a path.
ret  A newly-created `<gtk-tree-path>`, or `'#f'

**gtk-tree-path-append-index** *(self `<gtk-tree-path>`)*(index `int`)  [Function]
Appends a new index to a path. As a result, the depth of the path is increased.

`path`  A `<gtk-tree-path>`.
`index`  The index.

**gtk-tree-path-prepend-index** *(self `<gtk-tree-path>`)*(index `int`)  [Function]
Prepends a new index to a path. As a result, the depth of the path is increased.

`path`  A `<gtk-tree-path>`.
`index`  The index.

**gtk-tree-path-copy** *(self `<gtk-tree-path>`)*
⇒  *(ret `<gtk-tree-path>`)*
Creates a new `<gtk-tree-path>` as a copy of `path`.

`path`  A `<gtk-tree-path>`.
`ret`  A new `<gtk-tree-path>`.

**gtk-tree-row-reference-new** *(model `<gtk-tree-model>`)*
*(path `<gtk-tree-path>`)*  ⇒  *(ret `<gtk-tree-row-reference>`)*
Creates a row reference based on `path`. This reference will keep pointing to the node pointed to by `path`, so long as it exists. It listens to all signals emitted by `model`, and updates its path appropriately. If `path` isn't a valid path in `model`, then `'#f'` is returned.

`model`  A `<gtk-tree-model>`
`path`  A valid `<gtk-tree-path>` to monitor
`ret`  A newly allocated `<gtk-tree-row-reference>`, or `'#f'

**gtk-tree-row-reference-new-proxy** *(proxy `<gobject>`)*
*(model `<gtk-tree-model>`)*(path `<gtk-tree-path>`)*  ⇒  *(ret `<gtk-tree-row-reference>`)*
You do not need to use this function. Creates a row reference based on `path`. This reference will keep pointing to the node pointed to by `path`, so long as it exists. If `path` isn't a valid path in `model`, then `'#f'` is returned. However, unlike references created with `gtk-tree-row-reference-new`, it does not listen to the model for changes. The creator of the row reference must do this explicitly using `gtk-tree-row-reference-inserted`, `gtk-tree-row-reference-deleted`, `gtk-tree-row-reference-reordered`.

These functions must be called exactly once per proxy when the corresponding signal on the model is emitted. This single call updates all row references for that proxy. Since built-in GTK+ objects like `<gtk-tree-view>` already use this mechanism internally, using them as the proxy object will produce unpredictable results. Further
more, passing the same object as `model` and `proxy` doesn’t work for reasons of internal implementation.

This type of row reference is primarily meant by structures that need to carefully monitor exactly when a row reference updates itself, and is not generally needed by most applications.

- `proxy` A proxy `<gobject>`
- `model` A `<gtk-tree-model>`
- `path` A valid `<gtk-tree-path>` to monitor
- `ret` A newly allocated `<gtk-tree-row-reference>`, or ‘#f’

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

- `ret` A newly allocated `<gtk-tree-row-reference>`, or ‘#f’

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

- `ret` A newly allocated `<gtk-tree-row-reference>`, or ‘#f’

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

Since 2.8

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

```c
#include <gdk-pixbuf.h>

GtkTreeRowReference *gdk_pixbuf_new_for_data(...);
...
```

```
```markdown
**gtk-tree-row-reference-reordered** (proxy <gobject>)  
(path <gtk-tree-path>) (iter <gtk-tree-iter>) ⇒ (new-order int)

Let's a set of row reference created by **gtk-tree-row-reference-new-proxy** know that the model emitted the "rows_reordered" signal.

- **proxy**  A <gobject>
- **path**  The parent path of the reordered signal
- **iter**  The iter pointing to the parent of the reordered
- **new-order**  The new order of rows

**gtk-tree-iter-copy** (self <gtk-tree-iter>)  
⇒ (ret <gtk-tree-iter>)

Creates a dynamically allocated tree iterator as a copy of *iter*. This function is not intended for use in applications, because you can just copy the structs by value (`'GtkTreeIter new_iter = iter;`) . You must free this iter with **gtk-tree-iter-free**.

- **iter**  A <gtk-tree-iter>.
- **ret**  A newly-allocated copy of *iter*.

**gtk-tree-model-get-flags** (self <gtk-tree-model>)  
⇒ (ret <gtk-tree-model-flags>)

**get-flags**

Returns a set of flags supported by this interface. The flags are a bitwise combination of <gtk-tree-model-flags>. The flags supported should not change during the lifecycle of the *tree-model*.

- **tree-model**  A <gtk-tree-model>.
- **ret**  The flags supported by this interface.

**gtk-tree-model-get-n-columns** (self <gtk-tree-model>)  
⇒ (ret int)

**get-n-columns**

Returns the number of columns supported by *tree-model*.

- **tree-model**  A <gtk-tree-model>.
- **ret**  The number of columns.

**gtk-tree-model-get-column-type** (self <gtk-tree-model>)  
(index int) ⇒ (ret <gtype>)

**get-column-type**

Returns the type of the column.

- **tree-model**  A <gtk-tree-model>.
- **index**  The column index.
- **ret**  The type of the column.
Chapter 32: GtkTreeModel

```c
gtk-tree-model-get-iter (self <gtk-tree-model>)
(path <gtk-tree-path>) ⇒ (ret <gtk-tree-iter>)
```

**get-iter**

Sets `iter` to a valid iterator pointing to `path`.

- `tree-model` - A `<gtk-tree-model>`.
- `iter` - The uninitialized `<gtk-tree-iter>`.
- `path` - The `<gtk-tree-path>`.
- `ret` - '#t', if `iter` was set.

```c
gtk-tree-model-get-iter-first (self <gtk-tree-model>)
⇒ (ret <gtk-tree-iter>)
```

**get-iter-first**

Initializes `iter` with the first iterator in the tree (the one at the path "0") and returns '#t'. Returns '#f' if the tree is empty.

- `tree-model` - A `<gtk-tree-model>`.
- `iter` - The uninitialized `<gtk-tree-iter>`.
- `ret` - '#t', if `iter` was set.

```c
gtk-tree-model-get-path (self <gtk-tree-model>)
(iter <gtk-tree-iter>) ⇒ (ret <gtk-tree-path>)
```

**get-path**

Returns a newly-created `<gtk-tree-path>` referenced by `iter`. This path should be freed with `gtk-tree-path-free`.

- `tree-model` - A `<gtk-tree-model>`.
- `iter` - The `<gtk-tree-iter>`.
- `ret` - A newly-created `<gtk-tree-path>`.

```c
gtk-tree-model-get-value (self <gtk-tree-model>)
(iter <gtk-tree-iter>) (column int) ⇒ (ret scm)
```

**get-value**

Sets initializes and sets `value` to that at `column`. When done with `value`, `g-value-unset` needs to be called to free any allocated memory.

- `tree-model` - A `<gtk-tree-model>`.
- `iter` - The `<gtk-tree-iter>`.
- `column` - The column to lookup the value at.
- `value` - An empty `<gvalue>` to set.
g tk-tree-model-iter-next (self <gtk-tree-model>)  
  (iter <gtk-tree-iter>) ⇒ (ret <gtk-tree-iter>)  
iter-next  
Sets iter to point to the node following it at the current level. If there is no next iter, ‘#f’ is returned and iter is set to be invalid.

tree-model  
A <gtk-tree-model>.
iter  
The <gtk-tree-iter>.
ret  
‘#t’ if iter has been changed to the next node.

---

g tk-tree-model-iter-children (self <gtk-tree-model>)  
  (parent <gtk-tree-iter>) ⇒ (ret glist-of)  
iter-children  
Sets iter to point to the first child of parent. If parent has no children, ‘#f’ is returned and iter is set to be invalid. parent will remain a valid node after this function has been called.

If parent is ‘#f’ returns the first node, equivalent to ‘gtk_tree_model_get_iter_first’
(tree_model, iter);

tree-model  
A <gtk-tree-model>.
iter  
The new <gtk-tree-iter> to be set to the child.
parent  
The <gtk-tree-iter>, or ‘#f’
ret  
‘#t’, if child has been set to the first child.

---

g tk-tree-model-iter-has-child (self <gtk-tree-model>)  
  (iter <gtk-tree-iter>) ⇒ (ret bool)  
iter-has-child  
Returns ‘#t’ if iter has children, ‘#f’ otherwise.

tree-model  
A <gtk-tree-model>.
iter  
The <gtk-tree-iter> to test for children.
ret  
‘#t’ if iter has children.

---

g tk-tree-model-iter-n-children (self <gtk-tree-model>)  
  (iter <gtk-tree-iter>) ⇒ (ret int)  
iter-n-children  
Returns the number of children that iter has. As a special case, if iter is ‘#f’, then the number of toplevel nodes is returned.

tree-model  
A <gtk-tree-model>.
iter  
The <gtk-tree-iter>, or ‘#f’.
ret  
The number of children of iter.
Chapter 32: GtkTreeModel

```python
gtk-tree-model-iter-nth-child (self <gtk-tree-model>) (parent <gtk-tree-iter>) (n int) ⇒ (ret <gtk-tree-iter>)

iter-nth-child
Sets iter to be the child of parent, using the given index. The first index is 0. If n is too big, or parent has no children, iter is set to an invalid iterator and '#f' is returned. parent will remain a valid node after this function has been called. As a special case, if parent is '#f', then the nth root node is set.

tree-model
A <gtk-tree-model>.
iter
The <gtk-tree-iter> to set to the nth child.
parent
The <gtk-tree-iter> to get the child from, or '#f'.
n
Then index of the desired child.
ret
‘#t’, if parent has an nth child.
```

```python

iter-parent
Sets iter to be the parent of child. If child is at the toplevel, and doesn’t have a parent, then iter is set to an invalid iterator and '#f' is returned. child will remain a valid node after this function has been called.

tree-model
A <gtk-tree-model>.
iter
The new <gtk-tree-iter> to set to the parent.
child
The <gtk-tree-iter>.
ret
‘#t’, if iter is set to the parent of child.
```

```python

get-string-from-iter
Generates a string representation of the iter. This string is a ':' separated list of numbers. For example, "4:10:0:3" would be an acceptable return value for this string.

tree-model
A <gtk-tree-model>.
iter
An <gtk-tree-iter>.
ret
A newly-allocated string. Must be freed with g-free.

Since 2.2
```

```python
gtk-tree-model-ref-node (self <gtk-tree-model>) (iter <gtk-tree-iter>)

ref-node
Lets the tree ref the node. This is an optional method for models to implement. To be more specific, models may ignore this call as it exists primarily for performance reasons.
```
This function is primarily meant as a way for views to let caching model know when nodes are being displayed (and hence, whether or not to cache that node.) For example, a file-system based model would not want to keep the entire file-hierarchy in memory, just the sections that are currently being displayed by every current view. A model should be expected to be able to get an iter independent of its reffed state.

**gtk-tree-model-unref-node** *(self <gtk-tree-model>) (iter <gtk-tree-iter>)*

Unrefs the node. This is an optional method for models to implement. To be more specific, models may ignore this call as it exists primarily for performance reasons.

For more information on what this means, see [gtk-tree-model-ref-node](#). Please note that nodes that are deleted are not unrefed.

**gtk-tree-model-row-changed** *(self <gtk-tree-model>) (path <gtk-tree-path>) (iter <gtk-tree-iter>)*

Emits the "row_changed" signal on tree-model.

**gtk-tree-model-row-inserted** *(self <gtk-tree-model>) (path <gtk-tree-path>) (iter <gtk-tree-iter>)*

Emits the "row_inserted" signal on tree-model.

**gtk-tree-model-row-deleted** *(self <gtk-tree-model>) (path <gtk-tree-path>)*

Emits the "row_deleted" signal on tree-model. This should be called by models after a row has been removed. The location pointed to by path should be the location that the row previously was at. It may not be a valid location anymore.
**tree-model**

A `<gtk-tree-model>`

**path**

A `<gtk-tree-path>` pointing to the previous location of the deleted row.

**gtk-tree-model-rows-reordered** (self `<gtk-tree-model>`) [Function]

(path `<gtk-tree-path>`) (iter `<gtk-tree-iter>`) ⇒ (new-order int)

**rows-reordered** [Method]

Emits the "rows_reordered" signal on `tree-model`. This should be called by models when their rows have been reordered.

**tree-model**

A `<gtk-tree-model>`

**path**

A `<gtk-tree-path>` pointing to the tree node whose children have been reordered

**iter**

A valid `<gtk-tree-iter>` pointing to the node whose children have been reordered, or '#f' if the depth of `path` is 0.

**new-order**

an array of integers mapping the current position of each child to its old position before the re-ordering, i.e. `new-order'[newpos] = oldpos'`. 
Chapter 33: GtkTreeSelection

33 GtkTreeSelection

The selection object for

33.1 Overview

The <gtk-tree-selection> object is a helper object to manage the selection for a <gtk-tree-view> widget. The <gtk-tree-selection> object is automatically created when a new <gtk-tree-view> widget is created, and cannot exist independently of this widget. The primary reason the <gtk-tree-selection> objects exists is for cleanliness of code and API. That is, there is no conceptual reason all these functions could not be methods on the <gtk-tree-view> widget instead of a separate function.

The <gtk-tree-selection> object is gotten from a <gtk-tree-view> by calling gtk-tree-view-get-selection. It can be manipulated to check the selection status of the tree, as well as select and deselect individual rows. Selection is done completely view side. As a result, multiple views of the same model can have completely different selections. Additionally, you cannot change the selection of a row on the model that is not currently displayed by the view without expanding its parents first.

One of the important things to remember when monitoring the selection of a view is that the "changed" signal is mostly a hint. That is, it may only emit one signal when a range of rows is selected. Additionally, it may on occasion emit a "changed" signal when nothing has happened (mostly as a result of programmers calling select_row on an already selected row).

33.2 Usage

<gtk-tree-selection>  
[Class]  
Derives from <gobject>.  
This class defines no direct slots.

changed  
[Signal on <gtk-tree-selection>]  
Emitted whenever the selection has (possibly) changed. Please note that this signal is mostly a hint. It may only be emitted once when a range of rows are selected, and it may occasionally be emitted when nothing has happened.

gtk-tree-selection-set-mode (self <gtk-tree-selection>)  
(type <gtk-selection-mode>)  
[Function]  
set-mode  
[Method]  
Sets the selection mode of the selection. If the previous type was <gtk-selection-multiple>, then the anchor is kept selected, if it was previously selected.

selection  
A <gtk-tree-selection>.

type  
The selection mode

gtk-tree-selection-get-mode (self <gtk-tree-selection>)  
⇒ (ret <gtk-selection-mode>)  
[Function]  
get-mode  
[Method]  
Gets the selection mode for selection. See gtk-tree-selection-set-mode.
selection  a <gtk-tree-selection>
ret    the current selection mode

gtk-tree-selection-get-tree-view (self <gtk-tree-selection>)  [Function]
⇒ (ret <gtk-tree-view>)
get-tree-view  [Method]
   Returns the tree view associated with selection.
   selection   A <gtk-tree-selection>
   ret         A <gtk-tree-view>

gtk-tree-selection-get-selected (self <gtk-tree-selection>)  [Function]
⇒ (model <gtk-tree-model>) (iter <gtk-tree-iter>)
get-selected  [Method]
get-selected  [Method]
   Retrieve the current selection, if selection is set to <gtk-selection-single> or <gtk-
   selection-browse>.
   This function will not work if you use selection is <gtk-selection-multiple>.
   selection   A <gtk-tree-selection>.
   model       A pointer to set to the <gtk-tree-model>, or NULL.
   iter        The <gtk-tree-iter>, or NULL.

gtk-tree-selection-select-path (self <gtk-tree-selection>)  [Function]
(path <gtk-tree-path>)
select-path  [Method]
   Select the row at path.
   selection   A <gtk-tree-selection>.
   path        The <gtk-tree-path> to be selected.

gtk-tree-selection-unselect-path (self <gtk-tree-selection>)  [Function]
(path <gtk-tree-path>)
unselect-path  [Method]
   Unselects the row at path.
   selection   A <gtk-tree-selection>.
   path        The <gtk-tree-path> to be unselected.

gtk-tree-selection-path-is-selected  [Function]
   (self <gtk-tree-selection>) (path <gtk-tree-path>) ⇒ (ret bool)
path-is-selected  [Method]
   Returns ‘#t’ if the row pointed to by path is currently selected. If path does not point
   to a valid location, ‘#f’ is returned
   selection   A <gtk-tree-selection>.
   path        A <gtk-tree-path> to check selection on.
   ret         ‘#t’ if path is selected.
gtk-tree-selection-select-iter (self <gtk-tree-selection>)  [Function]
( iter <gtk-tree-iter> )
select-iter
Selects the specified iterator.

selection  A <gtk-tree-selection>.
iter        The <gtk-tree-iter> to be selected.

gtk-tree-selection-unselect-iter (self <gtk-tree-selection>)  [Function]
( iter <gtk-tree-iter> )
unselect-iter
Unselects the specified iterator.

selection  A <gtk-tree-selection>.
iter        The <gtk-tree-iter> to be unselected.

gtk-tree-selection-iter-is-selected [Function]
( self <gtk-tree-selection> ) ( iter <gtk-tree-iter> ) ⇒ ( ret bool )
iter-is-selected
Returns ‘#t’ if the row at iter is currently selected.

selection  A <gtk-tree-selection>
iter        A valid <gtk-tree-iter>
ret         ‘#t’, if iter is selected

gtk-tree-selection-select-all (self <gtk-tree-selection>)  [Function]
select-all
Selects all the nodes. selection must be set to <gtk-selection-multiple> mode.

selection  A <gtk-tree-selection>.

gtk-tree-selection-unselect-all (self <gtk-tree-selection>)  [Function]
unselect-all
Unselects all the nodes.

selection  A <gtk-tree-selection>.

gtk-tree-selection-select-range (self <gtk-tree-selection>)  [Function]
( start_path <gtk-tree-path> ) ( end_path <gtk-tree-path> )
select-range
Selects a range of nodes, determined by start-path and end-path inclusive. selection must be set to <gtk-selection-multiple> mode.

selection  A <gtk-tree-selection>.
start-path  The initial node of the range.
end-path    The final node of the range.
unselect-range

Unselects a range of nodes, determined by start-path and end-path inclusive.

### Parameters

- **selection**
  - A `<gtk-tree-selection>`.
- **start-path**
  - The initial node of the range.
- **end-path**
  - The initial node of the range.

Since 2.2
Chapter 34: GtkTreeViewColumn

34GtkTreeViewColumn

A visible column in a widget

34.1 Overview

The GtkTreeViewColumn object represents a visible column in a `<gtk-tree-view>` widget. It allows to set properties of the column header, and functions as a holding pen for the cell renderers which determine how the data in the column is displayed.

Please refer to the tree widget conceptual overview for an overview of all the objects and data types related to the tree widget and how they work together.

34.2 Usage

```
<gtk-tree-view-column>
    Derives from `<gtk-buildable>`, `<gtk-cell-layout>`, `<gtk-object>`.
    This class defines the following slots:
    visible Whether to display the column
    resizable Column is user-resizable
    width Current width of the column
    spacing Space which is inserted between cells
    sizing Resize mode of the column
    fixed-width Current fixed width of the column
    min-width Minimum allowed width of the column
    max-width Maximum allowed width of the column
    title Title to appear in column header
    expand Column gets share of extra width allocated to the widget
    clickable Whether the header can be clicked
    widget Widget to put in column header button instead of column title
    alignment X Alignment of the column header text or widget
    reorderable Whether the column can be reordered around the headers
    sort-indicator Whether to show a sort indicator
    sort-order Sort direction the sort indicator should indicate
```
Chapter 34: GtkTreeViewColumn

**clicked**  
[Signal on `<gtk-tree-view-column>`]

**gtk-tree-view-column-new** ⇒ *(ret `<gtk-tree-view-column>`)  
[Function]

Creates a new `<gtk-tree-view-column>`.

*ret*  
A newly created `<gtk-tree-view-column>`.

**gtk-tree-view-column-pack-start** *(self `<gtk-tree-view-column>`) (cell `<gtk-cell-renderer>`) (*expand* bool)  
[Method]

Packs the *cell* into the beginning of the column. If *expand* is ‘#f’, then the *cell* is allocated no more space than it needs. Any unused space is divided evenly between cells for which *expand* is ‘#t’.

*tree-column*  
A `<gtk-tree-view-column>`.

*cell*  
The `<gtk-cell-renderer>`.

*expand*  
‘#t’ if *cell* is to be given extra space allocated to *tree-column*.

**gtk-tree-view-column-pack-end** *(self `<gtk-tree-view-column>`) (cell `<gtk-cell-renderer>`) (*expand* bool)  
[Method]

Adds the *cell* to end of the column. If *expand* is ‘#f’, then the *cell* is allocated no more space than it needs. Any unused space is divided evenly between cells for which *expand* is ‘#t’.

*tree-column*  
A `<gtk-tree-view-column>`.

*cell*  
The `<gtk-cell-renderer>`.

*expand*  
‘#t’ if *cell* is to be given extra space allocated to *tree-column*.

**gtk-tree-view-column-clear** *(self `<gtk-tree-view-column>`)  
[Function]

[Method]

Unsets all the mappings on all renderers on the *tree-column*.

*tree-column*  
A `<gtk-tree-view-column>`

**gtk-tree-view-column-add-attribute** *(self `<gtk-tree-view-column>`) (cell_renderer `<gtk-cell-renderer>`) (attribute mchars) (column int)  
[Method]

Adds an attribute mapping to the list in *tree-column*. The *column* is the column of the model to get a value from, and the *attribute* is the parameter on *cell-renderer* to be set from the value. So for example if column 2 of the model contains strings, you could have the "text" attribute of a `<gtk-cell-renderer-text>` get its values from column 2.

*tree-column*  
A `<gtk-tree-view-column>`.
cell-renderer
   the `<gtk-cell-renderer>` to set attributes on
attribute
   An attribute on the renderer
column
   The column position on the model to get the attribute from.

`gtk-tree-view-column-set-spacing`          [Function]
   `(self <gtk-tree-view-column>) (spacing int)`
set-spacing
   Sets the spacing field of `tree-column`, which is the number of pixels to place between cell renderers packed into it.
   `tree-column`
      A `<gtk-tree-view-column>`.
   `spacing`
      distance between cell renderers in pixels.

`gtk-tree-view-column-get-spacing`        [Function]
   `(self <gtk-tree-view-column>) ⇒ (ret int)`
get-spacing
   Returns the spacing of `tree-column`.
   `tree-column`
      A `<gtk-tree-view-column>`.
   `ret`
      the spacing of `tree-column`.

`gtk-tree-view-column-set-visible`         [Function]
   `(self <gtk-tree-view-column>) (visible bool)`
set-visible
   Sets the visibility of `tree-column`.
   `tree-column`
      A `<gtk-tree-view-column>`.
   `visible`
      ‘#t’ if the `tree-column` is visible.

`gtk-tree-view-column-get-visible`        [Function]
   `(self <gtk-tree-view-column>) ⇒ (ret bool)`
geget-visible
   Returns ‘#t’ if `tree-column` is visible.
   `tree-column`
      A `<gtk-tree-view-column>`.
   `ret`
      whether the column is visible or not. If it is visible, then the tree will show the column.

`gtk-tree-view-column-set-resizable`      [Function]
   `(self <gtk-tree-view-column>) (resizable bool)`
set-resizable
   If `resizable` is ‘#t’, then the user can explicitly resize the column by grabbing the outer edge of the column button. If resizable is ‘#t’ and sizing mode of the column is `<gtk-tree-view-column-autosize>`, then the sizing mode is changed to `<gtk-tree-view-column-grow-only>`.
tree-column
A `<gtk-tree-view-column>`

resizable ‘#t’, if the column can be resized

gtk-tree-view-column-get-resizable

(Function)

```python
(self <gtk-tree-view-column>) ⇒ (ret bool)
get-resizable

Returns ‘#t’ if the tree-column can be resized by the end user.
```

tree-column
A `<gtk-tree-view-column>`

ret ‘#t’, if the tree-column can be resized.

gtk-tree-view-column-set-sizing (self <gtk-tree-view-column>)

(Function)

```python
(type <gtk-tree-view-column-sizing>)
set-sizing

Sets the growth behavior of tree-column to type.
```

tree-column
A `<gtk-tree-view-column>`.

type The `<gtk-tree-view-column-sizing>`.

gtk-tree-view-column-get-sizing (self <gtk-tree-view-column>)

(Function)

```python
⇒ (ret <gtk-tree-view-column-sizing>)
get-sizing

Returns the current type of tree-column.
```

tree-column
A `<gtk-tree-view-column>`.

ret The type of tree-column.

gtk-tree-view-column-get-width (self <gtk-tree-view-column>)

(Function)

```python
⇒ (ret int)
get-width

Returns the current size of tree-column in pixels.
```

tree-column
A `<gtk-tree-view-column>`.

ret The current width of tree-column.

gtk-tree-view-column-set-min-width

(Function)

```python
(self <gtk-tree-view-column>) (min_width int)
set-min-width

Sets the minimum width of the tree-column. If min-width is -1, then the minimum width is unset.
```

tree-column
A `<gtk-tree-view-column>`.

min-width The minimum width of the column in pixels, or -1.
gtk-tree-view-column-get-min-width [Function]

\[(self \, <\text{gtk-tree-view-column}>) \Rightarrow \text{(ret int)}\]

get-min-width [Method]

Returns the minimum width in pixels of the tree-column, or -1 if no minimum width is set.

tree-column

A <gtk-tree-view-column>.

ret

The minimum width of the tree-column.

gtk-tree-view-column-set-max-width [Function]

\[(self \, <\text{gtk-tree-view-column}>) (\text{max-width} \, \text{int})\]

set-max-width [Method]

Sets the maximum width of the tree-column. If max-width is -1, then the maximum width is unset. Note, the column can actually be wider than max width if it’s the last column in a view. In this case, the column expands to fill any extra space.

tree-column

A <gtk-tree-view-column>.

max-width

The maximum width of the column in pixels, or -1.

gtk-tree-view-column-get-max-width [Function]

\[(self \, <\text{gtk-tree-view-column}>) \Rightarrow \text{(ret int)}\]

get-max-width [Method]

Returns the maximum width in pixels of the tree-column, or -1 if no maximum width is set.

tree-column

A <gtk-tree-view-column>.

ret

The maximum width of the tree-column.

gtk-tree-view-column-clicked [Function]

\[(self \, <\text{gtk-tree-view-column}>)\]

clicked [Method]

Emits the "clicked" signal on the column. This function will only work if tree-column is clickable.

tree-column

A <gtk-tree-view-column>.

gtk-tree-view-column-set-title [Function]

\[(self \, <\text{gtk-tree-view-column}>) (\text{title} \, \text{mchars})\]

set-title [Method]

Sets the title of the tree-column. If a custom widget has been set, then this value is ignored.

tree-column

A <gtk-tree-view-column>.

title

The title of the tree-column.
** gtk-tree-view-column-get-title (self <gtk-tree-view-column>) **

.Function

get-title

Returns the title of the widget.

Illegal

A <gtk-tree-view-column>.

ret the title of the column. This string should not be modified or freed.

** gtk-tree-view-column-set-expand (self <gtk-tree-view-column>) **

.Function

set-expand

Sets the column to take available extra space. This space is shared equally amongst all columns that have the expand set to '#t'. If no column has this option set, then the last column gets all extra space. By default, every column is created with this '#f'.

Illegal

A <gtk-tree-view-column>

expand ' #t ' if the column should take available extra space, '#f' if not

Since 2.4

** gtk-tree-view-column-get-expand (self <gtk-tree-view-column>) **

.Function

get-expand

Return '#t' if the column expands to take any available space.

Illegal

A <gtk-tree-view-column>

ret '#t', if the column expands

Since 2.4

** gtk-tree-view-column-set-clickable (self <gtk-tree-view-column>) (clickable bool) **

.Function

set-clickable

Sets the header to be active if active is '#'t'. When the header is active, then it can take keyboard focus, and can be clicked.

Illegal

A <gtk-tree-view-column>.

clickable ' #t ' if the header is active.

** gtk-tree-view-column-get-clickable (self <gtk-tree-view-column>) ⇒ (ret bool) **

.Function

get-clickable

Returns '#t' if the user can click on the header for the column.

Illegal

A <gtk-tree-view-column>

ret '#t' if user can click the column header.
**gtk-tree-view-column-set-widget** *(self <gtk-tree-view-column>)*  
**set-widget**  
Sets the widget in the header to be *widget*. If *widget* is ‘#f’, then the header button is set with a <gtk-label> set to the title of *tree-column*.

*tree-column*   
A <gtk-tree-view-column>.

*widget*   
A child <gtk-widget>, or ‘#f’.

**gtk-tree-view-column-get-widget** *(self <gtk-tree-view-column>)*  
**get-widget**  
Returns the <gtk-widget> in the button on the column header. If a custom widget has not been set then ‘#f’ is returned.

*tree-column*   
A <gtk-tree-view-column>.

*ret*   
The <gtk-widget> in the column header, or ‘#f’

**gtk-tree-view-column-set-alignment** *(self <gtk-tree-view-column>)*  
**set-alignment**  
Sets the alignment of the title or custom widget inside the column header. The alignment determines its location inside the button – 0.0 for left, 0.5 for center, 1.0 for right.

*tree-column*   
A <gtk-tree-view-column>.

*xalign*   
The alignment, which is between [0.0 and 1.0] inclusive.

**gtk-tree-view-column-get-alignment** *(self <gtk-tree-view-column>)*  
**get-alignment**  
Returns the current x alignment of *tree-column*. This value can range between 0.0 and 1.0.

*tree-column*   
A <gtk-tree-view-column>.

*ret*   
The current alignent of *tree-column*.

**gtk-tree-view-column-set-sort-order** *(self <gtk-tree-view-column>)*  
**set-sort-order**  
Changes the appearance of the sort indicator. This does not actually sort the model. Use **gtk-tree-view-column-set-sort-column-id** if you want automatic sorting support. This function is primarily for custom sorting behavior, and should be used in conjunction with **gtk-tree-sortable-set-sort-column** to do that. For custom models, the mechanism will vary.
The sort indicator changes direction to indicate normal sort or reverse sort. Note that you must have the sort indicator enabled to see anything when calling this function; see `gtk-tree-view-column-set-sort-indicator`.

```plaintext
tree-column
    a <gtk-tree-view-column>

order  sort order that the sort indicator should indicate
```

```plaintext
gtk-tree-view-column-get-sort-order
    (self <gtk-tree-view-column>) ⇒ (ret <gtk-sort-type>)
[Function]

get-sort-order
    Gets the value set by `gtk-tree-view-column-set-sort-order`.

    tree-column
        a <gtk-tree-view-column>
        ret  the sort order the sort indicator is indicating
```

```plaintext
gtk-tree-view-column-focus-cell (self <gtk-tree-view-column>)  [Function]
    (cell <gtk-cell-renderer>)
[Method]

focus-cell
    Sets the current keyboard focus to be at `cell`, if the column contains 2 or more editable and activatable cells.

    tree-column
        A <gtk-tree-view-column>
        cell  A <gtk-cell-renderer>

Since 2.2
```

```plaintext
gtk-tree-view-column-queue-resize  [Function]
    (self <gtk-tree-view-column>)
[Method]

queue-resize
    Flags the column, and the cell renderers added to this column, to have their sizes renegotiated.

    tree-column
        A <gtk-tree-view-column>
```

Since 2.8
35  GtkTreeView

A widget for displaying both trees and lists

35.1  Overview

Widget that displays any object that implements the GtkTreeModel interface.

Please refer to the tree widget conceptual overview for an overview of all the objects and
data types related to the tree widget and how they work together.

35.2  Usage

`<gtk-tree-view>`  
[Class]

Derives from `<gtk-container>`.

This class defines the following slots:

- `model`  
The model for the tree view
- `hadj`  
  Horizontal Adjustment for the widget
- `vadj`  
  Vertical Adjustment for the widget
- `headers-visible`  
  Show the column header buttons
- `headers-clickable`  
  Column headers respond to click events
- `expander-column`  
  Set the column for the expander column
- `reorderable`  
  View is reorderable
- `rules-hint`  
  Set a hint to the theme engine to draw rows in alternating colors
- `enable-search`  
  View allows user to search through columns interactively
- `search-column`  
  Model column to search through when searching through code
- `fixed-height-mode`  
  Speeds up GtkTreeView by assuming that all rows have the same height
- `hover-selection`  
  Whether the selection should follow the pointer
- `hover-expand`  
  Whether rows should be expanded/collapsed when the pointer moves over them
show-expanders
View has expanders

level-indentation
Extra indentation for each level

rubber-banding
Whether to enable selection of multiple items by dragging the mouse pointer

enable-grid-lines
Whether grid lines should be drawn in the tree view

enable-tree-lines
Whether tree lines should be drawn in the tree view

tooltip-column
The column in the model containing the tooltip texts for the rows

move-cursor (arg0 <gtk-movement-step>) (arg1 <gint>) ⇒ <gboolean>
[Signal on <gtk-tree-view>]

set-scroll-adjustments (arg0 <gtk-adjustment>) (arg1 <gtk-adjustment>)
[Signal on <gtk-tree-view>]

select-all ⇒ <gboolean>
[Signal on <gtk-tree-view>]

unselect-all ⇒ <gboolean>
[Signal on <gtk-tree-view>]

row-activated (arg0 <gtk-tree-path>) (arg1 <gtk-tree-view-column>)
[Signal on <gtk-tree-view>]

The "row-activated" signal is emitted when the method gtk-tree-view-row-activated is called or the user double clicks a treeview row. It is also emitted when a non-editable row is selected and one of the keys: Space, Shift+Space, Return or Enter is pressed.

For selection handling refer to the tree widget conceptual overview as well as <gtk-tree-selection>.

test-expand-row (arg0 <gtk-tree-iter>) (arg1 <gtk-tree-path>) ⇒ <gboolean>
[Signal on <gtk-tree-view>]

The given row is about to be expanded (show its children nodes). Use this signal if you need to control the expandability of individual rows.

test-collapse-row (arg0 <gtk-tree-iter>) (arg1 <gtk-tree-path>) ⇒ <gboolean>
[Signal on <gtk-tree-view>]

The given row is about to be collapsed (hide its children nodes). Use this signal if you need to control the collapsibility of individual rows.

row-expanded (arg0 <gtk-tree-iter>) (arg1 <gtk-tree-path>)
[Signal on <gtk-tree-view>]

The given row has been expanded (child nodes are shown).

row-collapsed (arg0 <gtk-tree-iter>) (arg1 <gtk-tree-path>)
[Signal on <gtk-tree-view>]

The given row has been collapsed (child nodes are hidden).
**columns-changed**

The number of columns of the treeview has changed.

**cursor-changed**

The position of the cursor (focused cell) has changed.

**select-cursor-row (arg0 <gboolean>)**

⇒ <gboolean>

**toggle-cursor-row ⇒ <gboolean>**

**expand-collapse-cursor-row (arg0 <gboolean>)**

(arg1 <gboolean>) (arg2 <gboolean>) ⇒ <gboolean>

**select-cursor-parent ⇒ <gboolean>**

**start-interactive-search ⇒ <gboolean>**

**gtk-tree-view-new ⇒ (ret <gtk-widget>)**

Creates a new <gtk-tree-view> widget.

*ret* A newly created <gtk-tree-view> widget.

**gtk-tree-view-new-with-model (model <gtk-tree-model>)**

⇒ (ret <gtk-widget>)

Creates a new <gtk-tree-view> widget with the model initialized to *model*.

*model* the model.

*ret* A newly created <gtk-tree-view> widget.

**gtk-tree-view-get-model (self <gtk-tree-view>)**

⇒ (ret <gtk-tree-model>)

**get-model**

Returns the model the <gtk-tree-view> is based on. Returns ‘#f’ if the model is unset.

*tree-view* a <gtk-tree-view>

*ret* A <gtk-tree-model>, or ‘#f’ if none is currently being used.

**gtk-tree-view-set-model (self <gtk-tree-view>)**

*(model <gtk-tree-model>)*

**set-model**

Sets the model for a <gtk-tree-view>. If the *tree-view* already has a model set, it will remove it before setting the new model. If *model* is ‘#f’, then it will unset the old model.

*tree-view* A <gtk-tree-node>.

*model* The model.

**gtk-tree-view-get-selection (self <gtk-tree-view>)**

⇒ (ret <gtk-tree-selection>)

**get-selection**

Gets the <gtk-tree-selection> associated with *tree-view*. 
tree-view  A <gtk-tree-view>.
ret  A <gtk-tree-selection> object.

gtk-tree-view-get-hadjustment (self <gtk-tree-view>)  [Function]
⇒ (ret <gtk-adjustment>)
get-hadjustment  [Method]
   Gets the <gtk-adjustment> currently being used for the horizontal aspect.
   
   tree-view  A <gtk-tree-view>
   ret  A <gtk-adjustment> object, or ‘#f’ if none is currently being used.

gtk-tree-view-set-hadjustment (self <gtk-tree-view>)  [Function]
(adjustment <gtk-adjustment>)
set-hadjustment  [Method]
   Sets the <gtk-adjustment> for the current horizontal aspect.
   
   tree-view  A <gtk-tree-view>
   adjustment  The <gtk-adjustment> to set, or ‘#f’

gtk-tree-view-get-vadjustment (self <gtk-tree-view>)  [Function]
⇒ (ret <gtk-adjustment>)
get-vadjustment  [Method]
   Gets the <gtk-adjustment> currently being used for the vertical aspect.
   
   tree-view  A <gtk-tree-view>
   ret  A <gtk-adjustment> object, or ‘#f’ if none is currently being used.

gtk-tree-view-set-vadjustment (self <gtk-tree-view>)  [Function]
(adjustment <gtk-adjustment>)
set-vadjustment  [Method]
   Sets the <gtk-adjustment> for the current vertical aspect.
   
   tree-view  A <gtk-tree-view>
   adjustment  The <gtk-adjustment> to set, or ‘#f’

gtk-tree-view-get-headers-visible (self <gtk-tree-view>)  [Function]
⇒ (ret bool)
get-headers-visible  [Method]
   Returns ‘#t’ if the headers on the tree-view are visible.
   
   tree-view  A <gtk-tree-view>.
   ret  Whether the headers are visible or not.

gtk-tree-view-set-headers-visible (self <gtk-tree-view>)  [Function]
(headers_visible bool)
set-headers-visible  [Method]
   Sets the visibility state of the headers.
**tree-view**  A `<gtk-tree-view>`.

**headers-visible**  ‘#t’ if the headers are visible

```c
gtk-tree-view-columns-autosize (self <gtk-tree-view>)
```

**columns-autosize**  [Method]

Resizes all columns to their optimal width. Only works after the treeview has been realized.

```c
gtk-tree-view-get-headers-clickable (self <gtk-tree-view>)
```

**get-headers-clickable**  [Method]

Returns whether all header columns are clickable.

```c
⇒ (ret bool)
```

**ret**  ‘#t’ if all header columns are clickable, otherwise ‘#f’

Since 2.10

```c
gtk-tree-view-set-headers-clickable (self <gtk-tree-view>)
```

**set-headers-clickable**  [Method]

Allow the column title buttons to be clicked.

```c
(setting bool)
```

**setting**  ‘#t’ if the columns are clickable.

```c
gtk-tree-view-set-rules-hint (self <gtk-tree-view>)
```

**set-rules-hint**  [Method]

This function tells GTK+ that the user interface for your application requires users to read across tree rows and associate cells with one another. By default, GTK+ will then render the tree with alternating row colors. Do not use it just because you prefer the appearance of the ruled tree; that’s a question for the theme. Some themes will draw tree rows in alternating colors even when rules are turned off, and users who prefer that appearance all the time can choose those themes. You should call this function only as a semantic hint to the theme engine that your tree makes alternating colors useful from a functional standpoint (since it has lots of columns, generally).

```c
(setting bool)
```

**setting**  ‘#t’ if the tree requires reading across rows

```c
gtk-tree-view-get-rules-hint (self <gtk-tree-view>)
```

**get-rules-hint**  [Method]

Gets the setting set by `gtk-tree-view-set-rules-hint`.

```c
⇒ (ret bool)
```

**ret**  ‘#t’ if rules are useful for the user of this tree
**gtk-tree-view-append-column (self <gtk-tree-view>)**  
(Function)  
append-column  
Appends column to the list of columns. If tree-view has "fixed_height" mode enabled, then column must have its "sizing" property set to be GTK_TREE_VIEW_COLUMN_FIXED.  
  
  tree-view A <gtk-tree-view>.  
  column The <gtk-tree-view-column> to add.  
  ret The number of columns in tree-view after appending.  

**gtk-tree-view-remove-column (self <gtk-tree-view>)**  
(Function)  
remove-column  
Removes column from tree-view.  
  
  tree-view A <gtk-tree-view>.  
  column The <gtk-tree-view-column> to remove.  
  ret The number of columns in tree-view after removing.  

(Function)  
insert-column  
This inserts the column into the tree-view at position. If position is -1, then the column is inserted at the end. If tree-view has "fixed_height" mode enabled, then column must have its "sizing" property set to be GTK_TREE_VIEW_COLUMN_FIXED.  
  
  tree-view A <gtk-tree-view>.  
  column The <gtk-tree-view-column> to be inserted.  
  position The position to insert column in.  
  ret The number of columns in tree-view after insertion.  

**gtk-tree-view-get-column (self <gtk-tree-view>) (n int)⇒ (ret <gtk-tree-view-column>)**  
(Function)  
get-column  
Gets the <gtk-tree-view-column> at the given position in the <tree-view>.  
  
  tree-view A <gtk-tree-view>.  
  n The position of the column, counting from 0.  
  ret The <gtk-tree-view-column>, or ‘#f’ if the position is outside the range of columns.  

**gtk-tree-view-get-columns (self <gtk-tree-view>)⇒ (ret glist-of)**  
(Function)  
get-columns  
Returns a <g-list> of all the <gtk-tree-view-column> s currently in tree-view. The returned list must be freed with g-list-free.
**gtk-tree-view-move-column-after**

```
self <gtk-tree-view>
(column <gtk-tree-view-column>)
(base_column <gtk-tree-view-column>)
```

**Method**

Moves column to be after to base-column. If base-column is ‘#f’, then column is placed in the first position.

*tree-view*  A `<gtk-tree-view>`

*column*  The `<gtk-tree-view-column>` to be moved.

*base-column*  The `<gtk-tree-view-column>` to be moved relative to, or ‘#f’.

**gtk-tree-view-set-expander-column**

```
(self <gtk-tree-view>)
(column <gtk-tree-view-column>)
```

**Method**

Sets the column to draw the expander arrow at. It must be in tree-view. If column is ‘#f’, then the expander arrow is always at the first visible column.

If you do not want expander arrow to appear in your tree, set the expander column to a hidden column.

*tree-view*  A `<gtk-tree-view>`

*column*  ‘#f’, or the column to draw the expander arrow at.

**gtk-tree-view-get-expander-column**

```
(self <gtk-tree-view>)
⇒ (ret <gtk-tree-view-column>)
```

**Method**

Returns the column that is the current expander column. This column has the expander arrow drawn next to it.

*tree-view*  A `<gtk-tree-view>`

*ret*  The expander column.

**gtk-tree-view-scroll-to-point**

```
(self <gtk-tree-view>)
(tree_x int) (tree_y int)
```

**Method**

Scrolls the tree view such that the top-left corner of the visible area is tree-x, tree-y, where tree-x and tree-y are specified in tree window coordinates. The tree-view must be realized before this function is called. If it isn’t, you probably want to be using gtk-tree-view-scroll-to-cell.

If either tree-x or tree-y are -1, then that direction isn’t scrolled.

*tree-view*  a `<gtk-tree-view>`

*tree-x*  X coordinate of new top-left pixel of visible area, or -1

*tree-y*  Y coordinate of new top-left pixel of visible area, or -1
### gtk-tree-view-scroll-to-cell

**Function**

```c
(void) gtk-tree-view-scroll-to-cell (self <gtk-tree-view>)
(path <gtk-tree-path>) (column <gtk-tree-view-column>)
(use_align bool) (row_align float) (col_align float)
```

**scroll-to-cell**

Moves the alignments of `tree-view` to the position specified by `column` and `path`. If `column` is ‘#f’, then no horizontal scrolling occurs. Likewise, if `path` is ‘#f’ no vertical scrolling occurs. At a minimum, one of `column` or `path` need to be non-‘#f’. `row-align` determines where the row is placed, and `col-align` determines where `column` is placed. Both are expected to be between 0.0 and 1.0. 0.0 means left/top alignment, 1.0 means right/bottom alignment, 0.5 means center.

If `use-align` is ‘#f’, then the alignment arguments are ignored, and the tree does the minimum amount of work to scroll the cell onto the screen. This means that the cell will be scrolled to the edge closest to its current position. If the cell is currently visible on the screen, nothing is done.

This function only works if the model is set, and `path` is a valid row on the model. If the model changes before the `tree-view` is realized, the centered path will be modified to reflect this change.

- **tree-view**: A `<gtk-tree-view>`.
- **path**: The path of the row to move to, or ‘#f’.
- **column**: The `<gtk-tree-view-column>` to move horizontally to, or ‘#f’.
- **use-align**: whether to use alignment arguments, or ‘#f’.
- **row-align**: The vertical alignment of the row specified by `path`.
- **col-align**: The horizontal alignment of the column specified by `column`.

### gtk-tree-view-set-cursor

**Function**

```c
(void) gtk-tree-view-set-cursor (self <gtk-tree-view>)
(path <gtk-tree-path>) (focus_column <gtk-tree-view-column>)
(start_editing bool)
```

**set-cursor**

Sets the current keyboard focus to be at `path`, and selects it. This is useful when you want to focus the user’s attention on a particular row. If `focus-column` is not ‘#f’, then focus is given to the column specified by it. Additionally, if `focus-column` is specified, and `start-editing` is ‘#t’, then editing should be started in the specified cell. This function is often followed by `gtk-widget-grab-focus (tree-view)` in order to give keyboard focus to the widget. Please note that editing can only happen when the widget is realized.

- **tree-view**: A `<gtk-tree-view>`
- **path**: A `<gtk-tree-path>`
- **focus-column**: A `<gtk-tree-view-column>`, or ‘#f’
- **start-editing**: ‘#t’ if the specified cell should start being edited.
gtk-tree-view-set-cursor-on-cell (self <gtk-tree-view>) [Function]
  (path <gtk-tree-path>) (focus_column <gtk-tree-view-column>)
  (focus_cell <gtk-cell-renderer>) (start_editing bool)

set-cursor-on-cell [Method]
Sets the current keyboard focus to be at path, and selects it. This is useful when you
want to focus the user’s attention on a particular row. If focus-column is not ‘#f’,
then focus is given to the column specified by it. If focus-column and focus-cell are not
‘#f’, and focus-column contains 2 or more editable or activatable cells, then focus is
given to the cell specified by focus-cell. Additionally, if focus-column is specified, and
start-editing is ‘#t’, then editing should be started in the specified cell. This function
is often followed by gtk-widget-grab-focus (tree-view) in order to give keyboard focus
to the widget. Please note that editing can only happen when the widget is realized.

tree-view A <gtk-tree-view>
path A <gtk-tree-path>
focus-column
  A <gtk-tree-view-column>, or ‘#f’
focus-cell A <gtk-cell-renderer>, or ‘#f’
start-editing
  ‘#t’ if the specified cell should start being edited.

Since 2.2

gtk-tree-view-row-activated (self <gtk-tree-view>) [Function]
  (path <gtk-tree-path>) (column <gtk-tree-view-column>)
row-activated [Method]
  Activates the cell determined by path and column.
  tree-view A <gtk-tree-view>
  path The <gtk-tree-path> to be activated.
  column The <gtk-tree-view-column> to be activated.

gtk-tree-view-expand-all (self <gtk-tree-view>) [Function]
  expand-all [Method]
    Recursively expands all nodes in the tree-view.
    tree-view A <gtk-tree-view>.

gtk-tree-view-collapse-all (self <gtk-tree-view>) [Function]
collapse-all [Method]
  Recursively collapses all visible, expanded nodes in tree-view.
  tree-view A <gtk-tree-view>.

gtk-tree-view-expand-to-path (self <gtk-tree-view>) [Function]
  (path <gtk-tree-path>)
expand-to-path [Method]
  Expands the row at path. This will also expand all parent rows of path as necessary.
tree-view  A <gtk-tree-view>.
path  path to a row.

Since 2.2

**gtk-tree-view-expand-row** *(self <gtk-tree-view>)*  
**(path <gtk-tree-path>) (open_all bool) ⇒ (ret bool)***

**expand-row**  
Opens the row so its children are visible.

tree-view  a <gtk-tree-view>
path  path to a row
open-all  whether to recursively expand, or just expand immediate children
ret  ‘#t’ if the row existed and had children

**gtk-tree-view-collapse-row** *(self <gtk-tree-view>)*  
**(path <gtk-tree-path>) ⇒ (ret bool)***

**collapse-row**  
Collapses a row (hides its child rows, if they exist).

tree-view  a <gtk-tree-view>
path  path to a row in the tree-view
ret  ‘#t’ if the row was collapsed.

**gtk-tree-view-row-expanded** *(self <gtk-tree-view>)*  
**(path <gtk-tree-path>) ⇒ (ret bool)***

**row-expanded**  
Returns ‘#t’ if the node pointed to by path is expanded in tree-view.

tree-view  A <gtk-tree-view>.
path  A <gtk-tree-path> to test expansion state.
ret  ‘#t’ if <path> is expanded.

**gtk-tree-view-set-reorderable** *(self <gtk-tree-view>)*  
**(reorderable bool)***

**set-reorderable**  
This function is a convenience function to allow you to reorder models that support the <gtk-drag-source-iface> and the <gtk-drag-dest-iface>. Both <gtk-tree-store> and <gtk-list-store> support these. If reorderable is ‘#t’, then the user can reorder the model by dragging and dropping rows. The developer can listen to these changes by connecting to the model’s row_inserted and row_deleted signals. This function does not give you any degree of control over the order – any reordering is allowed. If more control is needed, you should probably handle drag and drop manually.

tree-view  A <gtk-tree-view>.
reorderable  ‘#t’, if the tree can be reordered.
gtk-tree-view-get-reorderable \((self \ <\ gtk\-tree\-view)\) \[\text{Function}\]
\[\Rightarrow \ (\text{ret} \ \text{bool})\]
get-reorderable \[\text{Method}\]
Retrieves whether the user can reorder the tree via drag-and-drop. See gtk-tree-view-set-reorderable.

tree-view \quad \text{a} <\text{gtk-tree-view}>

ret \quad \text{‘#t’ if the tree can be reordered.}

\[\text{gtk-tree-view-get-bin-window} \ (self \ <\ gtk\-tree\-view)\] \[\text{Function}\]
\[\Rightarrow \ (\text{ret} \ <\text{gdk-window})\]
get-bin-window \[\text{Method}\]
Returns the window that tree-view renders to. This is used primarily to compare to ‘event->window’ to confirm that the event on tree-view is on the right window.

tree-view \quad \text{A} <\text{gtk-tree-view}>

ret \quad \text{A} <\text{gdk-window}>, \text{or ‘#f’ when tree-view hasn’t been realized yet}

\[\text{gtk-tree-view-widget-to-tree-coords} \ (self \ <\ gtk\-tree\-view)\] \[\text{Function}\]
\((\text{wx} \ \text{int}) (\text{wy} \ \text{int}) \Rightarrow (\text{tx} \ \text{int}) (\text{ty} \ \text{int})\]
widget-to-tree-coords \[\text{Method}\]
Converts widget coordinates to coordinates for the tree window (the full scrollable area of the tree).

tree-view \quad \text{a} <\text{gtk-tree-view}>

wx \quad \text{widget X coordinate}

wy \quad \text{widget Y coordinate}

\text{tx} \quad \text{return location for tree X coordinate}

\text{ty} \quad \text{return location for tree Y coordinate}

\[\text{gtk-tree-view-tree-to-widget-coords} \ (self \ <\ gtk\-tree\-view)\] \[\text{Function}\]
\((\text{tx} \ \text{int}) (\text{ty} \ \text{int}) \Rightarrow (\text{wx} \ \text{int}) (\text{wy} \ \text{int})\]
tree-to-widget-coords \[\text{Method}\]
Converts tree coordinates (coordinates in full scrollable area of the tree) to widget coordinates.

tree-view \quad \text{a} <\text{gtk-tree-view}>

\text{tx} \quad \text{tree X coordinate}

\text{ty} \quad \text{tree Y coordinate}

\text{wx} \quad \text{return location for widget X coordinate}

\text{wy} \quad \text{return location for widget Y coordinate}

\[\text{gtk-tree-view-unset-rows-drag-dest} \ (self \ <\ gtk\-tree\-view)\] \[\text{Function}\]
unset-rows-drag-dest \[\text{Method}\]
Undoes the effect of gtk-tree-view-enable-model-drag-dest.

tree-view \quad \text{a} <\text{gtk-tree-view}>
The `gtk-tree-view-set-drag-dest-row` function sets the row that is highlighted for feedback.

```c
```

This function takes a `gtk-tree-view` as the `tree-view` parameter, a `gtk-tree-path` as the `path` parameter, and a `gtk-tree-view-drop-position` as the `pos` parameter. It sets the row that is highlighted for feedback.

The `set-drag-dest-row` method is used to set the drag destination row.

```c
method set-drag-dest-row (tree-view a <gtk-tree-view> path The path of the row to highlight, or '#f'. pos Specifies whether to drop before, after or into the row)
```

The `gtk-tree-view-create-row-drag-icon` function creates a `gdk-pixmap` representation of the row at `path`. This image is used for a drag icon.

```c
```

This function takes a `gtk-tree-view` as the `tree-view` parameter and a `gtk-tree-path` as the `path` parameter. It returns a newly-allocated pixmap of the drag icon.

The `create-row-drag-icon` method is used to create the drag icon for the row.

```c
method create-row-drag-icon (tree-view a <gtk-tree-view> path a <gtk-tree-path> in tree-view ret a newly-allocated pixmap of the drag icon)
```

The `gtk-tree-view-set-enable-search` function sets whether or not the tree allows to start interactive searching by typing in text.

```c
function gtk-tree-view-set-enable-search (self <gtk-tree-view>) (enable_search bool)
```

This function takes a `gtk-tree-view` as the `tree-view` parameter and a `bool` as the `enable_search` parameter. It sets whether or not the user can search interactively.

The `set-enable-search` method is used to enable or disable interactive searching.

```c
method set-enable-search (tree-view A <gtk-tree-view> enable-search 't', if the user can search interactively)
```

The `gtk-tree-view-get-enable-search` function returns whether or not the tree allows to start interactive searching by typing in text.

```c
function gtk-tree-view-get-enable-search (self <gtk-tree-view>) ⇒ (ret bool)
```

This function takes a `gtk-tree-view` as the `tree-view` parameter and returns a `bool` as the `ret` parameter.

The `get-enable-search` method is used to check if interactive searching is enabled.

```c
method get-enable-search (tree-view A <gtk-tree-view> ret whether or not to let the user search interactively)
```

The `gtk-tree-view-get-search-column` function gets the column searched on by the interactive search code.

```c
function gtk-tree-view-get-search-column (self <gtk-tree-view>) ⇒ (ret int)
```

This function takes a `gtk-tree-view` as the `tree-view` parameter and returns an `int` as the `ret` parameter.

The `get-search-column` method is used to get the search column.
gtk-tree-view-set-search-column (self <gtk-tree-view>) [Function]
  (column int)

set-search-column [Method]
Sets column as the column where the interactive search code should search in.
If the sort column is set, users can use the "start-interactive-search" key binding to bring up search popup. The enable-search property controls whether simply typing text will also start an interactive search.
Note that column refers to a column of the model.
tree-view  A <gtk-tree-view>
column  the column of the model to search in, or -1 to disable searching

gtk-tree-view-get-search-entry (self <gtk-tree-view>) [Function]
⇒ (ret <gtk-entry>)
get-search-entry [Method]
Returns the GtkEntry which is currently in use as interactive search entry for tree-view. In case the built-in entry is being used, '#f' will be returned.
tree-view  A <gtk-tree-view>
ret  the entry currently in use as search entry.

Since 2.10

gtk-tree-view-set-search-entry (self <gtk-tree-view>) [Function]
  (entry <gtk-entry>)
set-search-entry [Method]
Sets the entry which the interactive search code will use for this tree-view. This is useful when you want to provide a search entry in our interface at all time at a fixed position. Passing '#f' for entry will make the interactive search code use the built-in popup entry again.
tree-view  A <gtk-tree-view>
entry  the entry the interactive search code of tree-view should use or '#f'

Since 2.10

gtk-tree-view-get-fixed-height-mode (self <gtk-tree-view>) [Function]
⇒ (ret bool)
get-fixed-height-mode [Method]
Returns whether fixed height mode is turned on for tree-view.
tree-view  a <gtk-tree-view>
ret  '#t' if tree-view is in fixed height mode

Since 2.6

gtk-tree-view-set-fixed-height-mode (self <gtk-tree-view>) [Function]
  (enable bool)
set-fixed-height-mode [Method]
Enables or disables the fixed height mode of tree-view. Fixed height mode speeds up <gtk-tree-view> by assuming that all rows have the same height. Only
enable this option if all rows are the same height and all columns are of type ‘GTK_TREE_VIEW_COLUMN_FIXED’.

```
tree-view  a <gtk-tree-view>
enable    ‘#t’ to enable fixed height mode
```

Since 2.6

```
gtk-tree-view-get-hover-selection (self <gtk-tree-view>)  [Function]
  ⇒ (ret bool)
get-hover-selection  [Method]
  Returns whether hover selection mode is turned on for tree-view.
```

```
tree-view  a <gtk-tree-view>
ret        ‘#t’ if tree-view is in hover selection mode
```

Since 2.6

```
gtk-tree-view-set-hover-selection (self <gtk-tree-view>)  [Function]
  (hover bool)
set-hover-selection  [Method]
  Enables of disables the hover selection mode of tree-view. Hover selection makes the selected row follow the pointer. Currently, this works only for the selection modes ‘GTK_SELECTION_SINGLE’ and ‘GTK_SELECTION_BROWSE’.
```

```
tree-view  a <gtk-tree-view>
hover      ‘#t’ to enable hover selection mode
```

Since 2.6

```
gtk-tree-view-get-hover-expand (self <gtk-tree-view>)  [Function]
  ⇒ (ret bool)
get-hover-expand  [Method]
  Returns whether hover expansion mode is turned on for tree-view.
```

```
tree-view  a <gtk-tree-view>
ret        ‘#t’ if tree-view is in hover expansion mode
```

Since 2.6

```
gtk-tree-view-set-hover-expand (self <gtk-tree-view>)  [Function]
  (expand bool)
set-hover-expand  [Method]
  Enables of disables the hover expansion mode of tree-view. Hover expansion makes rows expand or collapse if the pointer moves over them.
```

```
tree-view  a <gtk-tree-view>
expand     ‘#t’ to enable hover selection mode
```

Since 2.6
gtk-tree-view-get-rubber-banding (self <gtk-tree-view>)  [Function]
⇒ (ret bool)

get-rubber-banding [Method]
Returns whether rubber banding is turned on for tree-view. If the selection mode is
<gtk-selection-multiple>, rubber banding will allow the user to select multiple rows by dragging the mouse.

  tree-view a <gtk-tree-view>
  ret  ‘#t’ if rubber banding in tree-view is enabled.

Since 2.10

gtk-tree-view-set-rubber-banding (self <gtk-tree-view>)  [Function]
 (enable bool)
set-rubber-banding [Method]
Enables or disables rubber banding in tree-view. If the selection mode is <gtk-
selection-multiple>, rubber banding will allow the user to select multiple rows by
dragging the mouse.

  tree-view a <gtk-tree-view>
  enable  ‘#t’ to enable rubber banding

Since 2.10

gtk-tree-view-get-enable-tree-lines (self <gtk-tree-view>)  [Function]
⇒ (ret bool)
get-enable-tree-lines [Method]
Returns whether or not tree lines are drawn in tree-view.

  tree-view a <gtk-tree-view>.
  ret  ‘#t’ if tree lines are drawn in tree-view, ‘#f’ otherwise.

Since 2.10

gtk-tree-view-set-enable-tree-lines (self <gtk-tree-view>)  [Function]
 (enabled bool)
set-enable-tree-lines [Method]
Sets whether to draw lines interconnecting the expanders in tree-view. This does not
have any visible effects for lists.

  tree-view a <gtk-tree-view>
  enabled  ‘#t’ to enable tree line drawing, ‘#f’ otherwise.

Since 2.10

gtk-tree-view-get-grid-lines (self <gtk-tree-view>)  [Function]
⇒ (ret <gtk-tree-view-grid-lines>)
get-grid-lines [Method]
Returns which grid lines are enabled in tree-view.

  tree-view a <gtk-tree-view>
Since 2.10

\begin{verbatim}
gtk-tree-view-set-grid-lines (self <gtk-tree-view>)
(grid_lines <gtk-tree-view-grid-lines>)
	set-grid-lines

Sets which grid lines to draw in tree-view.

\end{verbatim}

\begin{verbatim}
tree-view a <gtk-tree-view>

grid-lines a <gtk-tree-view-grid-lines> value indicating which grid lines to enable.
\end{verbatim}

Since 2.10
36 GtkTreeView drag-and-drop

Interfaces for drag-and-drop support in GtkTreeView

36.1 Overview

GTK+ supports Drag-and-Drop in tree views with a high-level and a low-level API.

On the other hand, if you write to the high-level API, then all the bookkeeping of rows is done for you, as well as things like hover-to-open and auto-scroll, but your models have to implement the <gtk-tree-drag-source> and <gtk-tree-drag-dest> interfaces.

36.2 Usage

<gtk-tree-drag-source> [Class]

Derives from <ginterface>.

This class defines no direct slots.

<gtk-tree-drag-dest> [Class]

Derives from <ginterface>.

This class defines no direct slots.

drag-data-get [Method]

Asks the <gtk-tree-drag-source> to fill in selection-data with a representation of the row at path. selection-data->target gives the required type of the data. Should robustly handle a path no longer found in the model!

drag-source

a <gtk-tree-drag-source>

path row that was dragged

selection-data

a <gtk-selection-data> to fill with data from the dragged row

ret ‘#t’ if data of the required type was provided

gtk-tree-drag-source-row-draggable [Function]

(self <gtk-tree-drag-source>) (path <gtk-tree-path>) ⇒ (ret bool)

row-draggable [Method]

Asks the <gtk-tree-drag-source> whether a particular row can be used as the source of a DND operation. If the source doesn’t implement this interface, the row is assumed draggable.
**drag-source**

a `<gtk-tree-drag-source>`

**path**

row on which user is initiating a drag

**ret**

`#t` if the row can be dragged

Sets selection data of target type `GTK_TREE_MODEL_ROW`. Normally used in a drag_data_get handler.

**selection-data**

some `<gtk-selection-data>`

**tree-model**

a `<gtk-tree-model>`

**path**

a row in `tree-model`

**ret**

`#t` if the `<gtk-selection-data>` had the proper target type to allow us to set a tree row
Chapter 37: GtkCellView

37 GtkCellView

A widget displaying a single row of a GtkTreeModel

37.1 Overview

A <gtk-cell-view> displays a single row of a <gtk-tree-model>, using cell renderers just like <gtk-tree-view>. <gtk-cell-view> doesn’t support some of the more complex features of <gtk-tree-view>, like cell editing and drag and drop.

37.2 Usage

<gtk-cell-view>  [Class]
    Derives from <gtk-cell-layout>, <gtk-widget>.
    This class defines the following slots:
    background
        Background color as a string
    background-gdk
        Background color as a GdkColor
    background-set
        Whether this tag affects the background color
    model
        The model for cell view

gtk-cell-view-new ⇒ (ret <gtk-widget>)  [Function]
    Creates a new <gtk-cell-view> widget.
    ret
        A newly created <gtk-cell-view> widget.
Since 2.6

gtk-cell-view-new-with-text (text mchars) ⇒ (ret <gtk-widget>)  [Function]
    Creates a new <gtk-cell-view> widget, adds a <gtk-cell-renderer-text> to it, and makes its show text.
    text
        the text to display in the cell view
    ret
        A newly created <gtk-cell-view> widget.
Since 2.6

gtk-cell-view-new-with-markup (markup mchars)
    ⇒ (ret <gtk-widget>)  [Function]
    Creates a new <gtk-cell-view> widget, adds a <gtk-cell-renderer-text> to it, and makes its show markup. The text can text can be marked up with the Pango text markup language.
    markup
        the text to display in the cell view
    ret
        A newly created <gtk-cell-view> widget.
Since 2.6
**gtk-cell-view-new-with-pixbuf (pixbuf <gdk-pixbuf>)**

⇒ (ret <gtk-widget>)

Creates a new `<gtk-cell-view>` widget, adds a `<gtk-cell-renderer-pixbuf>` to it, and makes its show pixbuf.

*pixbuf* the image to display in the cell view

*ret* A newly created `<gtk-cell-view>` widget.

Since 2.6

**gtk-cell-view-set-model (self <gtk-cell-view>)**

(set-model)

Sets the model for *cell-view*. If *cell-view* already has a model set, it will remove it before setting the new model. If *model* is `'#f'`, then it will unset the old model.

*cell-view* a `<gtk-cell-view>`

*model* a `<gtk-tree-model>`

Since 2.6

**gtk-cell-view-set-displayed-row (self <gtk-cell-view>)**

(set-displayed-row)

Sets the row of the model that is currently displayed by the `<gtk-cell-view>`. If the path is unset, then the contents of the cellview "stick" at their last value; this is not normally a desired result, but may be a needed intermediate state if say, the model for the `<gtk-cell-view>` becomes temporarily empty.

*cell-view* a `<gtk-cell-view>`

*path* a `<gtk-tree-path>` or `'#f'` to unset.

Since 2.6

**gtk-cell-view-get-displayed-row (self <gtk-cell-view>)**

⇒ (ret `<gtk-tree-path>`)  

(get-displayed-row)

Returns a `<gtk-tree-path>` referring to the currently displayed row. If no row is currently displayed, `'#f'` is returned.

*cell-view* a `<gtk-cell-view>`

*ret* the currently displayed row or `'#f'

Since 2.6

(set-size-of-row)

Sets *requisition* to the size needed by *cell-view* to display the model row pointed to by *path*.

*cell-view* a `<gtk-cell-view>`
Chapter 37: GtkCellView

path a <gtk-tree-path>
requisition return location for the size
ret ‘#t’

Since 2.6

gtk-cell-view-set-background-color (self <gtk-cell-view>) [Function]
(color <gdk-color>)
set-background-color [Method]
Sets the background color of view.
cell-view a <gtk-cell-view>
color the new background color

Since 2.6

gtk-cell-view-get-cell-renderers (self <gtk-cell-view>) [Function]
⇒ (ret glist-of)
get-cell-renderers [Method]
Returns the cell renderers which have been added to cell-view.

cell-view a <gtk-cell-view>
ret a list of cell renderers. The list, but not the renderers has been newly allocated and should be freed with g-list-free when no longer needed.

Since 2.6
38 GtkIconView

A widget which displays a list of icons in a grid

38.1 Overview

<gtk-icon-view> provides an alternative view on a list model. It displays the model as a grid of icons with labels. Like <gtk-tree-view>, it allows to select one or multiple items (depending on the selection mode, see <gtk-icon-view-set-selection-mode>). In addition to selection with the arrow keys, <gtk-icon-view> supports rubberband selection, which is controlled by dragging the pointer.

38.2 Usage

<gtk-icon-view>  
[Class]  
Derives from <gtk-cell-layout>, <gtk-container>.  
This class defines the following slots:  
  pixbuf-column  
  Model column used to retrieve the icon pixbuf from  
  text-column  
  Model column used to retrieve the text from  
  markup-column  
  Model column used to retrieve the text if using Pango markup  
  selection-mode  
  The selection mode  
  orientation  
  How the text and icon of each item are positioned relative to each other  
  model  
  The model for the icon view  
  columns  
  Number of columns to display  
  item-width  
  The width used for each item  
  spacing  
  Space which is inserted between cells of an item  
  row-spacing  
  Space which is inserted between grid rows  
  column-spacing  
  Space which is inserted between grid columns  
  margin  
  Space which is inserted at the edges of the icon view  
  reorderable  
  View is reorderable  
  tooltip-column  
  The column in the model containing the tooltip texts for the items
move-cursor \((\text{arg0} < \text{gtk-movement-step}>)\) \(\Rightarrow <\text{gboolean}>\) \[\text{Signal on <gtk-icon-view>}\]

selection-changed \[\text{Signal on <gtk-icon-view>}\]

set-scroll-adjustments \((\text{arg0} < \text{gtk-adjustment}) (\text{arg1} < \text{gtk-adjustment})\) \[\text{Signal on <gtk-icon-view>}\]

item-activated \((\text{arg0} < \text{gtk-tree-path})\) \[\text{Signal on <gtk-icon-view>}\]

select-all \[\text{Signal on <gtk-icon-view>}\]

unselect-all \[\text{Signal on <gtk-icon-view>}\]

select-cursor-item \[\text{Signal on <gtk-icon-view>}\]

toggle-cursor-item \[\text{Signal on <gtk-icon-view>}\]

activate-cursor-item \(\Rightarrow <\text{gboolean}>\) \[\text{Signal on <gtk-icon-view>}\]

gtk-icon-view-new \(\Rightarrow (\text{ret} < \text{gtk-widget}>)\) \[\text{Function}\]

\text{Creates a new <gtk-icon-view> widget}

\text{ret} \quad \text{A newly created <gtk-icon-view> widget}

Since 2.6

gtk-icon-view-new-with-model \((\text{model} < \text{gtk-tree-model})\) \[\text{Function}\]

\(\Rightarrow (\text{ret} < \text{gtk-widget}>)\)

\text{Creates a new <gtk-icon-view> widget with the model model.}

\text{model} \quad \text{The model.}

\text{ret} \quad \text{A newly created <gtk-icon-view> widget.}

Since 2.6

gtk-icon-view-set-model \((\text{self} < \text{gtk-icon-view}) (\text{model} < \text{gtk-tree-model})\) \[\text{Function}\]

\text{set-model} \[\text{Method}\]

\text{Sets the model for a <gtk-icon-view>. If the icon-view already has a model set, it will remove it before setting the new model. If model is ‘#f’, then it will unset the old model.}

\text{icon-view} \quad \text{A <gtk-icon-view>.}

\text{model} \quad \text{The model.}

Since 2.6

gtk-icon-view-get-model \((\text{self} < \text{gtk-icon-view})\) \[\text{Function}\]

\(\Rightarrow (\text{ret} < \text{gtk-tree-model})\)

\text{get-model} \[\text{Method}\]

\text{Returns the model the <gtk-icon-view> is based on. Returns ‘#f’ if the model is unset.}

\text{icon-view} \quad \text{a <gtk-icon-view>}

\text{ret} \quad \text{A <gtk-tree-model>, or ‘#f’ if none is currently being used.}

Since 2.6
Chapter 38: GtkIconView

```c
gtk-icon-view-set-text-column (self <gtk-icon-view>)
  (column int)

set-text-column
[Method]
  Sets the column with text for icon-view to be column. The text column must be of type <g-type-string>.
  icon-view  A <gtk-icon-view>.
  column     A column in the currently used model.

Since 2.6
```

```c
gtk-icon-view-get-text-column (self <gtk-icon-view>)
⇒ (ret int)

get-text-column
[Method]
  Returns the column with text for icon-view.
  icon-view  A <gtk-icon-view>.
  ret        the text column, or -1 if it's unset.

Since 2.6
```

```c
gtk-icon-view-set-markup-column (self <gtk-icon-view>)
  (column int)

set-markup-column
[Method]
  Sets the column with markup information for icon-view to be column. The markup column must be of type <g-type-string>. If the markup column is set to something, it overrides the text column set by gtk-icon-view-set-text-column.
  icon-view  A <gtk-icon-view>.
  column     A column in the currently used model.

Since 2.6
```

```c
gtk-icon-view-get-markup-column (self <gtk-icon-view>)
⇒ (ret int)

get-markup-column
[Method]
  Returns the column with markup text for icon-view.
  icon-view  A <gtk-icon-view>.
  ret        the markup column, or -1 if it's unset.

Since 2.6
```

```c
gtk-icon-view-set-pixbuf-column (self <gtk-icon-view>)
  (column int)

set-pixbuf-column
[Method]
  Sets the column with pixbufs for icon-view to be column. The pixbuf column must be of type <gdk-type-pixbuf>
  icon-view  A <gtk-icon-view>.
  column     A column in the currently used model.

Since 2.6
```
gtk-icon-view-get-pixbuf-column (self <gtk-icon-view>) ⇒ (ret int)  

get-pixbuf-column  
Returns the column with pixbufs for icon-view.

icon-view  A <gtk-icon-view>.
ret  the pixbuf column, or -1 if it’s unset.

Since 2.6

gtk-icon-view-get-path-at-pos (self <gtk-icon-view>) (x int) (y int) ⇒ (ret <gtk-tree-path>)  

get-path-at-pos  
Finds the path at the point (x, y), relative to widget coordinates. See gtk-icon-view-get-item-at-pos, if you are also interested in the cell at the specified position.

icon-view  A <gtk-icon-view>.
x  The x position to be identified
y  The y position to be identified
ret  The <gtk-tree-path> corresponding to the icon or ‘#f’ if no icon exists at that position.

Since 2.6

gtk-icon-view-set-cursor (self <gtk-icon-view>) (path <gtk-tree-path>) (cell <gtk-cell-renderer>) (start_editing bool)  

set-cursor  
Sets the current keyboard focus to be at path, and selects it. This is useful when you want to focus the user’s attention on a particular item. If cell is not ‘#f’, then focus is given to the cell specified by it. Additionally, if start-editing is ‘#t’, then editing should be started in the specified cell.

This function is often followed by ‘gtk_widget_grab_focus (icon_view)’ in order to give keyboard focus to the widget. Please note that editing can only happen when the widget is realized.

icon-view  A <gtk-icon-view>
path  A <gtk-tree-path>
cell  One of the cell renderers of icon-view, or ‘#f’
start-editing  ‘#t’ if the specified cell should start being edited.

Since 2.8

gtk-icon-view-set-selection-mode (self <gtk-icon-view>) (mode <gtk-selection-mode>)  

set-selection-mode  
Sets the selection mode of the icon-view.

icon-view  A <gtk-icon-view>. 
**mode**    The selection mode

Since 2.6

```c
gtk-icon-view-get-selection-mode (self <gtk-icon-view>) [Function]
⇒ (ret <gtk-selection-mode>)
```

**get-selection-mode**    [Method]

Gets the selection mode of the *icon-view*.

*icon-view*    A `<gtk-icon-view>`.

*ret*    the current selection mode

Since 2.6

```c
gtk-icon-view-set-orientation (self <gtk-icon-view>) (orientation <gtk-orientation>) [Function]
```

**set-orientation**    [Method]

Sets the `::orientation` property which determines whether the labels are drawn beside
the icons instead of below.

*icon-view*    a `<gtk-icon-view>`

*orientation* the relative position of texts and icons

Since 2.6

```c
gtk-icon-view-get-orientation (self <gtk-icon-view>) [Function]
⇒ (ret <gtk-orientation>)
```

**get-orientation**    [Method]

Returns the value of the `::orientation` property which determines whether the labels
are drawn beside the icons instead of below.

*icon-view*    a `<gtk-icon-view>`

*ret*    the relative position of texts and icons

Since 2.6

```c
gtk-icon-view-set-columns (self <gtk-icon-view>) (columns int) [Function]
```

**set-columns**    [Method]

Sets the `::columns` property which determines in how many columns the icons are
arranged. If *columns* is -1, the number of columns will be chosen automatically to fill
the available area.

*icon-view*    a `<gtk-icon-view>`

*columns*    the number of columns

Since 2.6

```c
gtk-icon-view-get-columns (self <gtk-icon-view>) ⇒ (ret int) [Function]
```

**get-columns**    [Method]

Returns the value of the `::columns` property.
icon-view a <gtk-icon-view>
ret the number of columns, or -1

Since 2.6

gtk-icon-view-set-item-width (self <gtk-icon-view>) [Function]
(item_width int)

set-item-width [Method]
Sets the ::item-width property which specifies the width to use for each item. If it is set to -1, the icon view will automatically determine a suitable item size.

icon-view a <gtk-icon-view>
item-width the width for each item

Since 2.6

gtk-icon-view-get-item-width (self <gtk-icon-view>) [Function]
⇒ (ret int)

get-item-width [Method]
Returns the value of the ::item-width property.

icon-view a <gtk-icon-view>
ret the width of a single item, or -1

Since 2.6

gtk-icon-view-set-spacing (self <gtk-icon-view>) (spacing int) [Function]

set-spacing [Method]
Sets the ::spacing property which specifies the space which is inserted between the cells (i.e. the icon and the text) of an item.

icon-view a <gtk-icon-view>
spacing the spacing

Since 2.6

gtk-icon-view-get-spacing (self <gtk-icon-view>) ⇒ (ret int) [Function]

get-spacing [Method]
Returns the value of the ::spacing property.

icon-view a <gtk-icon-view>
ret the space between cells

Since 2.6

gtk-icon-view-set-row-spacing (self <gtk-icon-view>) (row_spacing int) [Function]

set-row-spacing [Method]
Sets the ::row-spacing property which specifies the space which is inserted between the rows of the icon view.
icon-view  a <gtk-icon-view>

row-spacing
  the row spacing

Since 2.6

gtk-icon-view-get-row-spacing (self <gtk-icon-view>)  [Function]
  ⇒ (ret int)
get-row-spacing  [Method]
  Returns the value of the ::row-spacing property.

icon-view  a <gtk-icon-view>
ret  the space between rows

Since 2.6

gtk-icon-view-set-column-spacing (self <gtk-icon-view>)  [Function]
  (column_spacing int)
set-column-spacing  [Method]
  Sets the ::column-spacing property which specifies the space which is inserted between
  the columns of the icon view.

icon-view  a <gtk-icon-view>
column-spacing  the column spacing

Since 2.6

gtk-icon-view-get-column-spacing (self <gtk-icon-view>)  [Function]
  ⇒ (ret int)
get-column-spacing  [Method]
  Returns the value of the ::column-spacing property.

icon-view  a <gtk-icon-view>
ret  the space between columns

Since 2.6

gtk-icon-view-set-margin (self <gtk-icon-view>)  [Function]
  (margin int)
set-margin  [Method]
  Sets the ::margin property which specifies the space which is inserted at the top,
  bottom, left and right of the icon view.

icon-view  a <gtk-icon-view>
margin  the margin

Since 2.6

gtk-icon-view-get-margin (self <gtk-icon-view>) ⇒ (ret int)  [Function]
get-margin  [Method]
  Returns the value of the ::margin property.
icon-view  a <gtk-icon-view>
ret        the space at the borders

Since 2.6

gtk-icon-view-select-path (self <gtk-icon-view>)                    [Function]
  (path <gtk-tree-path>)  
select-path            [Method]
  Selects the row at path.
icon-view   A <gtk-icon-view>.
path        The <gtk-tree-path> to be selected.

Since 2.6

gtk-icon-view-unselect-path (self <gtk-icon-view>)              [Function]
  (path <gtk-tree-path>)  
unselect-path         [Method]
  Unselects the row at path.
icon-view   A <gtk-icon-view>.
path        The <gtk-tree-path> to be unselected.

Since 2.6

gtk-icon-view-path-is-selected (self <gtk-icon-view>)             [Function]
  (path <gtk-tree-path>) ⇒ (ret bool)  
path-is-selected               [Method]
  Returns ‘#t’ if the icon pointed to by path is currently selected. If icon does not point to a valid location, ‘#f’ is returned.
icon-view   A <gtk-icon-view>.
path        A <gtk-tree-path> to check selection on.
ret         ‘#t’ if path is selected.

Since 2.6

gtk-icon-view-get-selected-items (self <gtk-icon-view>)           [Function]
  ⇒ (ret glist-of)      
get-selected-items        [Method]
  Creates a list of paths of all selected items. Additionally, if you are planning on modifying the model after calling this function, you may want to convert the returned list into a list of <gtk-tree-row-reference>s. To do this, you can use gtk-tree-row-reference-new.
  
To free the return value, use:

    g_list_foreach (list, gtk_tree_path_free, NULL);
    g_list_free (list);

icon-view   A <gtk-icon-view>.
A `<g-list>` containing a `<gtk-tree-path>` for each selected row.

Since 2.6

```python
def gtk_icon_view_select_all(self):
    # Method
    Selects all the icons. `icon-view` must have its selection mode set to `<gtk-selection-multiple>`.

    `icon-view`  A `<gtk-icon-view>`.
```

Since 2.6

```python
def gtk_icon_view_unselect_all(self):
    # Method
    Unselects all the icons.

    `icon-view`  A `<gtk-icon-view>`.
```

Since 2.6

```python
def gtk_icon_view_item_activated(self, path):
    # Method
    Activates the item determined by `path`.

    `icon-view`  A `<gtk-icon-view>`
    `path`  The `<gtk-tree-path>` to be activated
```

Since 2.6

```python
def gtk_icon_view_scroll_to_path(self, path, use_align='#f', row_align=0.5, col_align=0.5):
    # Method
    Moves the alignments of `icon-view` to the position specified by `path`. `row-align` determines where the row is placed, and `col-align` determines where `column` is placed. Both are expected to be between 0.0 and 1.0. 0.0 means left/top alignment, 1.0 means right/bottom alignment, 0.5 means center.

    If `use-align` is `#f`, then the alignment arguments are ignored, and the tree does the minimum amount of work to scroll the item onto the screen. This means that the item will be scrolled to the edge closest to its current position. If the item is currently visible on the screen, nothing is done.

    This function only works if the model is set, and `path` is a valid row on the model. If the model changes before the `icon-view` is realized, the centered path will be modified to reflect this change.

    `icon-view`  A `<gtk-icon-view>`.
    `path`  The path of the item to move to.
    `use-align`  whether to use alignment arguments, or `#f`.
    `row-align`  The vertical alignment of the item specified by `path`.
```
The horizontal alignment of the item specified by `path`.

Since 2.8

`gtk-icon-view-unset-model-drag-dest (self <gtk-icon-view>)` [Function]

`unset-model-drag-dest` [Method]

Undoes the effect of `gtk-icon-view-enable-model-drag-dest`.

`icon-view` a `<gtk-icon-view>`

Since 2.8

`gtk-icon-view-set-reorderable (self <gtk-icon-view>)` [Function]

```
(reorderable bool)
```

`set-reorderable` [Method]

This function is a convenience function to allow you to reorder models that support the `<gtk-tree-drag-source-iface>` and the `<gtk-tree-drag-dest-iface>`. Both `<gtk-tree-store>` and `<gtk-list-store>` support these. If `reorderable` is `#t`, then the user can reorder the model by dragging and dropping rows. The developer can listen to these changes by connecting to the model’s `row_inserted` and `row_deleted` signals.

This function does not give you any degree of control over the order – any reordering is allowed. If more control is needed, you should probably handle drag and drop manually.

`icon-view` A `<gtk-icon-view>`.

`reorderable` `#t`, if the list of items can be reordered.

Since 2.8

`gtk-icon-view-get-reorderable (self <gtk-icon-view>)` [Function]

```
⇒ (ret bool)
```

`get-reorderable` [Method]

Retrieves whether the user can reorder the list via drag-and-drop. See `gtk-icon-view-set-reorderable`.

`icon-view` a `<gtk-icon-view>`

`ret` `#t` if the list can be reordered.

Since 2.8

`gtk-icon-view-set-drag-dest-item (self <gtk-icon-view>)` [Function]

```
(path <gtk-tree-path>) (pos <gtk-icon-view-drop-position>)
```

`set-drag-dest-item` [Method]

Sets the item that is highlighted for feedback.

`icon-view` a `<gtk-icon-view>`

`path` The path of the item to highlight, or `#f`.

`pos` Specifies where to drop, relative to the item

Since 2.8
create-drag-icon

Creates a `<gdk-pixmap>` representation of the item at `path`. This image is used for a drag icon.

- `icon-view`: a `gtk-icon-view`
- `path`: a `gtk-tree-path` in `icon-view`
- `ret`: a newly-allocated pixmap of the drag icon.

Since 2.8
39 GtkTreeSortable

The interface for sortable models used by GtkTreeView

39.1 Overview

<gtk-tree-sortable> is an interface to be implemented by tree models which support sorting. The <gtk-tree-view> uses the methods provided by this interface to sort the model.

39.2 Usage

<gtk-tree-sortable> [Class]

Derives from <ginterface>.

This class defines no direct slots.

sort-column-changed [Signal on <gtk-tree-sortable>]
40 GtkTreeModelSort

A GtkTreeModel which makes an underlying tree model sortable

40.1 Overview

The <gtk-tree-model-sort> is a model which implements the <gtk-tree-sortable> interface. It does not hold any data itself, but rather is created with a child model and proxies its data. It has identical column types to this child model, and the changes in the child are propagated. The primary purpose of this model is to provide a way to sort a different model without modifying it. Note that the sort function used by <gtk-tree-model-sort> is not guaranteed to be stable.

The use of this is best demonstrated through an example. In the following sample code we create two <gtk-tree-view> widgets each with a view of the same data. As the model is wrapped here by a <gtk-tree-model-sort>, the two <gtk-tree-view>s can each sort their view of the data without affecting the other. By contrast, if we simply put the same model in each widget, then sorting the first would sort the second.

```c

{  GtkTreeView *tree_view1;
   GtkTreeView *tree_view2;
   GtkTreeModel *sort_model1;
   GtkTreeModel *sort_model2;
  GtkTreeModel *child_model;

   /* get the child model */
   child_model = get_my_model ();

   /* Create the first tree */
   sort_model1 = gtk_tree_model_sort_new_with_model (child_model);
   tree_view1 = gtk_tree_view_new_with_model (sort_model1);

   /* Create the second tree */
   sort_model2 = gtk_tree_model_sort_new_with_model (child_model);
   tree_view2 = gtk_tree_view_new_with_model (sort_model2);

   /* Now we can sort the two models independently */
   gtk_tree_sortable_set_sort_column_id (GTK_TREE_SORTABLE (sort_model1),
                                        COLUMN_1, GTK_SORT_ASCENDING);
   gtk_tree_sortable_set_sort_column_id (GTK_TREE_SORTABLE (sort_model2),
                                        COLUMN_1, GTK_SORT_DESCENDING);
}
```

To demonstrate how to access the underlying child model from the sort model, the next example will be a callback for the <gtk-tree-selection> "changed" signal. In this callback, we get a string from COLUMN_1 of the model. We then modify the string, find the same selected row on the child model, and change the row there.
void
selection_changed (GtkTreeSelection *selection, gpointer data)
{
    GtkWidget *sort_model = NULL;
    GtkWidget *child_model;
    GtkWidget sort_iter;
    GtkWidget child_iter;
    char *some_data = NULL;
    char *modified_data;

    /* Get the current selected row and the model. */
    if (! gtk_tree_selection_get_selected (selection,
        &sort_model,
        &sort_iter))
        return;

    /* Look up the current value on the selected row and get a new value
     * to change it to.
     */
    gtk_tree_model_get (GTK_TREE_MODEL (sort_model), &sort_iter,
        COLUMN_1, &some_data,
        -1);

    modified_data = change_the_data (some_data);
    g_free (some_data);

    /* Get an iterator on the child model, instead of the sort model. */
    gtk_tree_model_sort_convert_iter_to_child_iter (GTK_TREE_MODEL_SORT (sort_model),
        &child_iter,
        &sort_iter);

    /* Get the child model and change the value of the row. In this
     * example, the child model is a GtkListStore. It could be any other
     * type of model, though.
     */
    child_model = gtk_tree_model_sort_get_model (GTK_TREE_MODEL_SORT (sort_model));
    gtk_list_store_set (GTK_LIST_STORE (child_model), &child_iter,
        COLUMN_1, &modified_data,
        -1);
    g_free (modified_data);
}

40.2 Usage

<gtk-tree-model-sort> [Class]
Derives from <gtk-tree-model>, <gtk-tree-sortable>, <gtk-tree-drag-source>,
<gobject>.
This class defines the following slots:

  model  The model for the TreeModelSort to sort

gtk-tree-model-sort-new-with-model [Function]
  (child_model <gtk-tree-model>) ⇒ (ret <gtk-tree-model>)
Creates a new <gtk-tree-model>, with child-model as the child model.

  child-model
  A <gtk-tree-model>

  ret
  A new <gtk-tree-model>.

gtk-tree-model-sort-get-model (self <gtk-tree-model-sort>) [Function]
  ⇒ (ret <gtk-tree-model>)
get-model
Returns the model the <gtk-tree-model-sort> is sorting.

  tree-model
  a <gtk-tree-model-sort>

  ret
  the "child model" being sorted

gtk-tree-model-sort-clear-cache (self <gtk-tree-model-sort>) [Function]
clear-cache [Method]
This function should almost never be called. It clears the tree-model-sort of any
cached iterators that haven't been reffed with gtk-tree-model-ref-node. This
might be useful if the child model being sorted is static (and doesn’t change often)
and there has been a lot of unreffed access to nodes. As a side effect of this function,
all unreffed iters will be invalid.

  tree-model-sort
  A <gtk-tree-model-sort>

gtk-tree-model-sort-iter-is-valid [Function]
  (self <gtk-tree-model-sort>) (iter <gtk-tree-iter>) ⇒ (ret bool)
iter-is-valid [Method]
This function is slow. Only use it for debugging and/or testing purposes.
Checks if the given iter is a valid iter for this <gtk-tree-model-sort>.

  tree-model-sort
  A <gtk-tree-model-sort>.

  iter
  A <gtk-tree-iter>.

  ret
  ‘#t’ if the iter is valid, ‘#f’ if the iter is invalid.

Since 2.2
41 GtkTreeModelFilter

A GtkTreeModel which hides parts of an underlying tree model

41.1 Overview

A <gtk-tree-model-filter> is a tree model which wraps another tree model, and can do the following things:

Filter specific rows, based on data from a "visible column", a column storing booleans indicating whether the row should be filtered or not, or based on the return value of a "visible function", which gets a model, iter and user_data and returns a boolean indicating whether the row should be filtered or not.

Modify the "appearance" of the model, using a modify function. This is extremely powerful and allows for just changing some values and also for creating a completely different model based on the given child model.

Set a different root node, also known as a "virtual root". You can pass in a <gtk-tree-path> indicating the root node for the filter at construction time.

41.2 Usage

<gtk-tree-model-filter>  
[Class]

This class defines the following slots:

child-model
  The model for the filtermodel to filter

virtual-root
  The virtual root (relative to the child model) for this filtermodel

gtk-tree-model-filter-new (self <gtk-tree-model>)  
[Function]

(root <gtk-tree-path>) ⇒ (ret <gtk-tree-model>)

filter-new
  Creates a new <gtk-tree-model>, with child-model as the child_model and root as the virtual root.

child-model
  A <gtk-tree-model>.

root
  A <gtk-tree-path> or '#f'.

ret
  A new <gtk-tree-model>.

Since 2.4

gtk-tree-model-filter-get-model  
[Function]

(self <gtk-tree-model-filter>) ⇒ (ret <gtk-tree-model>)

get-model
  Returns a pointer to the child model of filter.

filter
  A <gtk-tree-model-filter>.
A pointer to a `<gtk-tree-model>`.

Since 2.4

gtk-tree-model-filter-refilter (self `<gtk-tree-model-filter>`)  [Function]
refilter  [Method]
Emits `:row_changed` for each row in the child model, which causes the filter to re-evaluate whether a row is visible or not.

filter  A `<gtk-tree-model-filter>`.

Since 2.4

gtk-tree-model-filter-clear-cache  [Function]
clear-cache  [Method]
This function should almost never be called. It clears the `filter` of any cached iterators that haven’t been reffed with `gtk-tree-model-ref-node`. This might be useful if the child model being filtered is static (and doesn’t change often) and there has been a lot of unreffed access to nodes. As a side effect of this function, all unreffed iters will be invalid.

filter  A `<gtk-tree-model-filter>`.

Since 2.4
Chapter 42: GtkCellLayout

42 GtkCellLayout

An interface for packing cells

42.1 Overview

<gtk-cell-layout> is an interface to be implemented by all objects which want to provide a <gtk-tree-view-column-like> API for packing cells, setting attributes and data funcs.

One of the notable features provided by implementations of GtkCellLayout are attributes. Attributes let you set the properties in flexible ways. They can just be set to constant values like regular properties. But they can also be mapped to a column of the underlying tree model with gtk-cell-layout-set-attributes, which means that the value of the attribute can change from cell to cell as they are rendered by the cell renderer. Finally, it is possible to specify a function with gtk-cell-layout-set-cell-data-func that is called to determine the value of the attribute for each cell that is rendered.

42.2 Usage

<gtk-cell-layout> [Class]

Derives from <ginterface>.

This class defines no direct slots.

pack-start [Method]

Packs the cell into the beginning of cell-layout. If expand is ‘#f’, then the cell is allocated no more space than it needs. Any unused space is divided evenly between cells for which expand is ‘#t’.

Note that reusing the same cell renderer is not supported.

cell-layout A <gtk-cell-layout>.

cell A <gtk-cell-renderer>.

expanded ‘#t’ if cell is to be given extra space allocated to cell-layout.

Since 2.4

pack-end [Method]

Adds the cell to the end of cell-layout. If expand is ‘#f’, then the cell is allocated no more space than it needs. Any unused space is divided evenly between cells for which expand is ‘#t’.

Note that reusing the same cell renderer is not supported.

cell-layout A <gtk-cell-layout>.

cell A <gtk-cell-renderer>.

expanded ‘#t’ if cell is to be given extra space allocated to cell-layout.

Since 2.4
gtk-cell-layout-reorder (self <gtk-cell-layout>)  
  (cell <gtk-cell-renderer>) (position int)  

reorder  
    Re-inserts cell at position. Note that cell has already to be packed into cell-layout for this to function properly.

  cell-layout  A <gtk-cell-layout>.
  cell  A <gtk-cell-renderer> to reorder.
  position  New position to insert cell at.

Since 2.4

gtk-cell-layout-clear (self <gtk-cell-layout>)  

clear  
    Unsets all the mappings on all renderers on cell-layout and removes all renderers from cell-layout.

  cell-layout  A <gtk-cell-layout>.

Since 2.4

gtk-cell-layout-add-attribute (self <gtk-cell-layout>)  
  (cell <gtk-cell-renderer>) (attribute mchars) (column int)  

add-attribute  
    Adds an attribute mapping to the list in cell-layout. The column is the column of the model to get a value from, and the attribute is the parameter on cell to be set from the value. So for example if column 2 of the model contains strings, you could have the "text" attribute of a <gtk-cell-renderer-text> get its values from column 2.

  cell-layout  A <gtk-cell-layout>.
  cell  A <gtk-cell-renderer>.
  attribute  An attribute on the renderer.
  column  The column position on the model to get the attribute from.

Since 2.4

gtk-cell-layout-clear-attributes (self <gtk-cell-layout>)  
  (cell <gtk-cell-renderer>)  

clear-attributes  
    Clears all existing attributes previously set with gtk-cell-layout-set-attributes.

  cell-layout  A <gtk-cell-layout>.
  cell  A <gtk-cell-renderer> to clear the attribute mapping on.

Since 2.4
43 GtkCellRenderer

An object for rendering a single cell on a

43.1 Overview

The `<gtk-cell-renderer>` is a base class of a set of objects used for rendering a cell to a `<gdk-drawable>`. These objects are used primarily by the `<gtk-tree-view>` widget, though they aren’t tied to them in any specific way. It is worth noting that `<gtk-cell-renderer>` is not a `<gtk-widget>` and cannot be treated as such.

The primary use of a `<gtk-cell-renderer>` is for drawing a certain graphical elements on a `<gdk-drawable>`. Typically, one cell renderer is used to draw many cells on the screen. To this extent, it isn’t expected that a CellRenderer keep any permanent state around. Instead, any state is set just prior to use using `<gobject>`s property system. Then, the cell is measured using `<gtk-cell-renderer-get-size>`. Finally, the cell is rendered in the correct location using `<gtk-cell-renderer-render>`.

There are a number of rules that must be followed when writing a new `<gtk-cell-renderer>`. First and foremost, it’s important that a certain set of properties will always yield a cell renderer of the same size, barring a `<gtk-style>` change. The `<gtk-cell-renderer>` also has a number of generic properties that are expected to be honored by all children.

Beyond merely rendering a cell, cell renderers can optionally provide active user interface elements. A cell renderer can be activatable like `<gtk-cell-renderer-toggle>`, which toggles when it gets activated by a mouse click, or it can be editable like `<gtk-cell-renderer-text>`, which allows the user to edit the text using a `<gtk-entry>`. To make a cell renderer activatable or editable, you have to implement the activate or start-editing virtual functions, respectively.

43.2 Usage

`<gtk-cell-renderer>`

```plaintext
[Class]
Derives from `<gtk-object>`.
This class defines the following slots:
mode          Editable mode of the CellRenderer
visible       Display the cell
sensitive     Display the cell sensitive
xalign        The x-align
yalign        The y-align
xpad          The xpad
ypad          The ypad
width         The fixed width
```
height  The fixed height
is-expander  Row has children
is-expanded  Row is an expander row, and is expanded
cell-background  Cell background color as a string
cell-background-gdk  Cell background color as a GdkColor
cell-background-set  Whether this tag affects the cell background color

editing-cancelled  [Signal on <gtk-cell-renderer>]
This signal gets emitted when the user cancels the process of editing a cell. For example, an editable cell renderer could be written to cancel editing when the user presses Escape.
See also: gtk-cell-renderer-editing-cancelled
Since 2.4

editing-started  [Signal on <gtk-cell-renderer>]
(arg0 <gtk-cell-editable>) (arg1 <gchararray>)
This signal gets emitted when a cell starts to be edited. The intended use of this signal is to do special setup on editable, e.g. adding a <gtk-entry-completion> or setting up additional columns in a <gtk-combo-box>.
Note that GTK+ doesn’t guarantee that cell renderers will continue to use the same kind of widget for editing in future releases, therefore you should check the type of editable before doing any specific setup, as in the following example:

    static void
text_editing_started (GtkCellRenderer *cell,
               GtkWidget *cell, GtkWidget *editable,
               gchar *path,
               gpointer data)
    {
        if (GTK_IS_ENTRY (editable))
        {
            GtkEntry *entry = GTK_ENTRY (editable);

            /* ... create a GtkEntryCompletion */

            gtk_entry_set_completion (entry, completion);
        }
    }
Since 2.6
gtk-cell-renderer-render (self <gtk-cell-renderer>) [Function]
(window <gdk-window>) (widget <gtk-widget>)
(background_area <gdk-rectangle>) (cell_area <gdk-rectangle>)
(expose_area <gdk-rectangle>) (flags <gtk-cell-renderer-state>)
render
Invokes the virtual render function of the <gtk-cell-renderer>. The three passed-in rectangles are areas of window. Most renderers will draw within cell-area; the xalign, yalign, xpad, and ypad fields of the <gtk-cell-renderer> should be honored with respect to cell-area. background-area includes the blank space around the cell, and also the area containing the tree expander; so the background-area rectangles for all cells tile to cover the entire window. expose-area is a clip rectangle.

  cell a <gtk-cell-renderer>
  window a <gdk-drawable> to draw to
  widget the widget owning window
  background-area
    entire cell area (including tree expanders and maybe padding on the sides)
  cell-area
    area normally rendered by a cell renderer
  expose-area
    area that actually needs updating
  flags flags that affect rendering

gtk-cell-renderer-activate (self <gtk-cell-renderer>) [Function]
(event <gdk-event>) (widget <gtk-widget>) (path mchars)
(background_area <gdk-rectangle>) (cell_area <gdk-rectangle>)
(flags <gtk-cell-renderer-state>) ⇒ (ret bool)
activate
Passes an activate event to the cell renderer for possible processing. Some cell renderers may use events; for example, <gtk-cell-renderer-toggle> toggles when it gets a mouse click.

  cell a <gtk-cell-renderer>
  event a <gdk-event>
  widget widget that received the event
  path widget-dependent string representation of the event location; e.g. for <gtk-tree-view>, a string representation of <gtk-tree-path>
  background-area
    background area as passed to gtk-cell-renderer-render
  cell-area cell area as passed to gtk-cell-renderer-render
  flags render flags
  ret ‘#t’ if the event was consumed/handled
**gtk-cell-renderer-start-editing**

```python
```

**start-editing**

Passes an activate event to the cell renderer for possible processing.

- **cell**
  - a `gtk-cell-renderer`
- **event**
  - a `gdk-event`
- **widget**
  - widget that received the event
- **path**
  - widget-dependent string representation of the event location; e.g. for `gtk-tree-view`, a string representation of `gtk-tree-path`
- **background-area**
  - background area as passed to `gtk-cell-renderer-render`
- **cell-area**
  - cell area as passed to `gtk-cell-renderer-render`
- **flags**
  - render flags
- **ret**
  - A new `gtk-cell-editable`, or `#f`

**gtk-cell-renderer-editing-canceled**

```python
(gtk-cell-renderer) [Function]
```

**editing-canceled**

'`gtk_cell_renderer_editing_canceled`' has been deprecated since version 2.6 and should not be used in newly-written code. Use `gtk-cell-renderer-stop-editing` instead

Causes the cell renderer to emit the "editing-canceled" signal. This function is for use only by implementations of cell renderers that need to notify the client program that an editing process was canceled and the changes were not committed.

- **cell**
  - A `gtk-cell-renderer`

Since 2.4

**gtk-cell-renderer-stop-editing**

```python
(gtk-cell-renderer) (bool) [Function]
```

**stop-editing**

Informs the cell renderer that the editing is stopped. If `canceled` is `#t`, the cell renderer will emit the "editing-canceled" signal. This function should be called by cell renderer implementations in response to the "editing-done" signal of `gtk-cell-editable`.

- **cell**
  - A `gtk-cell-renderer`
- **canceled**
  - `#t` if the editing has been canceled

Since 2.6

**gtk-cell-renderer-get-fixed-size**

```python
(gtk-cell-renderer) [Function]
```

**get-fixed-size**

Fills in `width` and `height` with the appropriate size of `cell`. 
cell    A `<gtk-cell-renderer>`
width   location to fill in with the fixed width of the widget, or ‘#f’
height  location to fill in with the fixed height of the widget, or ‘#f’

**gtk-cell-renderer-set-fixed-size** (self `<gtk-cell-renderer>`)  
(width int) (height int)  

Sets the renderer size to be explicit, independent of the properties set.

*cell*    A `<gtk-cell-renderer>`
*width*   the width of the cell renderer, or -1
*height*  the height of the cell renderer, or -1
Chapter 44: GtkCellEditable

44 GtkCellEditable

Interface for widgets which can are used for editing cells

44.1 Overview

The `<gtk-cell-editable>` interface must be implemented for widgets to be usable when editing the contents of a `<gtk-tree-view>` cell.

44.2 Usage

`<gtk-cell-editable>`

[Class]

Derives from `<ginterface>`.

This class defines no direct slots.

- **editing-done**
  [Signal on `<gtk-cell-editable>`]

- **remove-widget**
  [Signal on `<gtk-cell-editable>`]

`gtk-cell-editable-start-editing (self <gtk-cell-editable>)`  
[event `<gdk-event>`]

[start-editing]  
[Method]

Begins editing on a cell-editable. event is the `<gdk-event>` that began the editing process. It may be ‘#f’, in the instance that editing was initiated through programatic means.

- **cell-editable**
  A `<gtk-cell-editable>`

- **event**
  A `<gdk-event>`, or ‘#f’

`gtk-cell-editable-editing-done (self <gtk-cell-editable>)`  
[Function]

[Method]

Emits the "editing_done" signal. This signal is a sign for the cell renderer to update its value from the cell.

- **cell-editable**
  A `<gtk-tree-editable>`

`gtk-cell-editable-remove-widget (self <gtk-cell-editable>)`  
[Function]

[Method]

Emits the "remove_widget" signal. This signal is meant to indicate that the cell is finished editing, and the widget may now be destroyed.

- **cell-editable**
  A `<gtk-tree-editable>`
45 GtkCellRendererAccel

Renders a keyboard accelerator in a cell

45.1 Overview

<gtk-cell-renderer-accel> displays a keyboard accelerator (i.e. a key combination like <Control>-a). If the cell renderer is editable, the accelerator can be changed by simply typing the new combination.

The <gtk-cell-renderer-accel> cell renderer was added in GTK+ 2.10.

45.2 Usage

<gtk-cell-renderer-accel> [Class]

Derives from <gtk-cell-renderer-text>.

This class defines the following slots:

- accel-key
  The keyval of the accelerator

- accel-mods
  The modifier mask of the accelerator

- keycode
  The hardware keycode of the accelerator

- accel-mode
  The type of accelerators

accel-edited (arg0 <gchararray>) [Signal on <gtk-cell-renderer-accel>]
  (arg1 <guint>) (arg2 <gdk-modifier-type>) (arg3 <guint>)

Gets emitted when the user has selected a new accelerator.

Since 2.10

accel-cleared (arg0 <gchararray>) [Signal on <gtk-cell-renderer-accel>]

Gets emitted when the user has removed the accelerator.

Since 2.10

gtk-cell-renderer-accel-new ⇒ (ret <gtk-cell-renderer>) [Function]

Creates a new <gtk-cell-renderer-accel>.

ret the new cell renderer

Since 2.10
Chapter 46: GtkCellRendererCombo

46 GtkCellRendererCombo

Renders a combobox in a cell

46.1 Overview

<gtk-cell-renderer-combo> renders text in a cell like <gtk-cell-renderer-text> from which it is derived. But while <gtk-cell-renderer-text> offers a simple entry to edit the text, <gtk-cell-renderer-combo> offers a <gtk-combo-box> or <gtk-combo-box-entry> widget to edit the text. The values to display in the combo box are taken from the tree model specified in the model property.

The combo cell renderer takes care of adding a text cell renderer to the combo box and sets it to display the column specified by its text-column property. Further properties of the combo box can be set in a handler for the editing-started signal.

The <gtk-cell-renderer-combo> cell renderer was added in GTK+ 2.6.

46.2 Usage

<gtk-cell-renderer-combo> [Class]

Derives from <gtk-cell-renderer-text>. This class defines the following slots:

- **model**: The model containing the possible values for the combo box
- **text-column**: A column in the data source model to get the strings from
- **has-entry**: If FALSE, don’t allow to enter strings other than the chosen ones

**gtk-cell-renderer-combo-new ⇒ (ret <gtk-cell-renderer>)** [Function]

Creates a new <gtk-cell-renderer-combo>. Adjust how text is drawn using object properties. Object properties can be set globally (with `g-object-set`). Also, with <gtk-tree-view-column>, you can bind a property to a value in a <gtk-tree-model>. For example, you can bind the "text" property on the cell renderer to a string value in the model, thus rendering a different string in each row of the <gtk-tree-view>.

- **ret**: the new cell renderer

Since 2.6
Chapter 47: GtkCellRendererPixbuf

47 GtkCellRendererPixbuf

Renders a pixbuf in a cell

47.1 Overview

A `<gtk-cell-renderer-pixbuf>` can be used to render an image in a cell. It allows to render either a given `<gdk-pixbuf>` (set via the pixbuf property) or a stock icon (set via the stock-id property).

To support the tree view, `<gtk-cell-renderer-pixbuf>` also supports rendering two alternative pixbufs, when the is-expander property is `'#t'`. If the is-expanded property is `'#t'` and the pixbuf-expander-open property is set to a pixbuf, it renders that pixbuf, if the is-expanded property is `'#f'` and the pixbuf-expander-closed property is set to a pixbuf, it renders that one.

47.2 Usage

 `<gtk-cell-renderer-pixbuf>` [Class]

Derives from `<gtk-cell-renderer>`. This class defines the following slots:

- pixbuf The pixbuf to render
- pixbuf-expander-open Pixbuf for open expander
- pixbuf-expander-closed Pixbuf for closed expander
- stock-id The stock ID of the stock icon to render
- stock-size The GtkIconSize value that specifies the size of the rendered icon
- stock-detail Render detail to pass to the theme engine
- follow-state Whether the rendered pixbuf should be colorized according to the state
- icon-name The name of the icon from the icon theme

`gtk-cell-renderer-pixbuf-new ⇒ (ret <gtk-cell-renderer>)` [Function]

Creates a new `<gtk-cell-renderer-pixbuf>`. Adjust rendering parameters using object properties. Object properties can be set globally (with `g-object-set`). Also, with `<gtk-tree-view-column>`, you can bind a property to a value in a `<gtk-tree-model>`. For example, you can bind the "pixbuf" property on the cell renderer to a pixbuf value in the model, thus rendering a different image in each row of the `<gtk-tree-view>`.

ret the new cell renderer
48 GtkCellRendererProgress

Renders numbers as progress bars

48.1 Overview

<gtk-cell-renderer-progress> renders a numeric value as a progress par in a cell. Ad-
ditionally, it can display a text on top of the progress bar.

The <gtk-cell-renderer-progress> cell renderer was added in GTK+ 2.6.

48.2 Usage

<gtk-cell-renderer-progress>                                [Class]
Derives from <gtk-cell-renderer>.

This class defines the following slots:

value       Value of the progress bar

text        Text on the progress bar

pulse       Set this to positive values to indicate that some progress is made, but
             you don’t know how much.

text-xalign The horizontal text alignment, from 0 (left) to 1 (right). Reversed for
             RTL layouts.

text-yalign The vertical text alignment, from 0 (top) to 1 (bottom).

orientation Orientation and growth direction of the progress bar

gtk-cell-renderer-progress-new ⇒ (ret <gtk-cell-renderer>)[Function]
Creates a new <gtk-cell-renderer-progress>.

ret         the new cell renderer

Since 2.6
49 GtkCellRendererSpin

Renders a spin button in a cell

49.1 Overview

<gtk-cell-renderer-spin> renders text in a cell like <gtk-cell-renderer-text> from which it is derived. But while <gtk-cell-renderer-text> offers a simple entry to edit the text, <gtk-cell-renderer-spin> offers a <gtk-spin-button> widget. Of course, that means that the text has to be parseable as a floating point number.

The range of the spinbutton is taken from the adjustment property of the cell renderer, which can be set explicitly or mapped to a column in the tree model, like all properties of cell renders. <gtk-cell-renderer-spin> also has properties for the climb rate and the number of digits to display. Other <gtk-spin-button> properties can be set in a handler for the start-editing signal.

The <gtk-cell-renderer-spin> cell renderer was added in GTK+ 2.10.

49.2 Usage

<gtk-cell-renderer-spin> [Class]
Derives from <gtk-cell-renderer-text>.
This class defines the following slots:

adjustment
The adjustment that holds the value of the spinbutton.

climb-rate
The acceleration rate when you hold down a button
digits
The number of decimal places to display

gtk-cell-renderer-spin-new ⇒ (ret <gtk-cell-renderer>) [Function]
Creates a new <gtk-cell-renderer-spin>.

ret a new <gtk-cell-renderer-spin>

Since 2.10
50 GtkCellRendererText

Renders text in a cell

50.1 Overview

A `<gtk-cell-renderer-text>` renders a given text in its cell, using the font, color and style information provided by its properties. The text will be ellipsized if it is too long and the ellipsize property allows it.

If the mode is `GTK_CELL_RENDERER_MODE_EDITABLE`, the `<gtk-cell-renderer-text>` allows to edit its text using an entry.

50.2 Usage

```
<gtk-cell-renderer-text>
```

[Class]

Derives from `<gtk-cell-renderer>`.

This class defines the following slots:

- **text**
  Text to render

- **markup**
  Marked up text to render

- **attributes**
  A list of style attributes to apply to the text of the renderer

- **single-paragraph-mode**
  Whether or not to keep all text in a single paragraph

- **width-chars**
  The desired width of the label, in characters

- **wrap-width**
  The width at which the text is wrapped

- **alignment**
  How to align the lines

- **background**
  Background color as a string

- **foreground**
  Foreground color as a string

- **background-gdk**
  Background color as a GdkColor

- **foreground-gdk**
  Foreground color as a GdkColor

- **font**
  Font description as a string, e.g. "Sans Italic 12"

- **font-desc**
  Font description as a PangoFontDescription struct

- **family**
  Name of the font family, e.g. Sans, Helvetica, Times, Monospace
style Font style
variant Font variant
weight Font weight
stretch Font stretch
size Font size
size-points Font size in points
scale Font scaling factor
editable Whether the text can be modified by the user
strikethrough Whether to strike through the text
underline Style of underline for this text
rise Offset of text above the baseline (below the baseline if rise is negative)
language The language this text is in, as an ISO code. Pango can use this as a hint when rendering the text. If you don’t understand this parameter, you probably don’t need it
ellipsize The preferred place to ellipsize the string, if the cell renderer does not have enough room to display the entire string
wrap-mode How to break the string into multiple lines, if the cell renderer does not have enough room to display the entire string
background-set Whether this tag affects the background color
foreground-set Whether this tag affects the foreground color
family-set Whether this tag affects the font family
style-set Whether this tag affects the font style
variant-set Whether this tag affects the font variant
weight-set Whether this tag affects the font weight
stretch-set Whether this tag affects the font stretch
size-set Whether this tag affects the font size
scale-set  
Whether this tag scales the font size by a factor

editable-set  
Whether this tag affects text editability

strikethrough-set  
Whether this tag affects strikethrough

underline-set  
Whether this tag affects underlining

rise-set  
Whether this tag affects the rise

language-set  
Whether this tag affects the language the text is rendered as

ellipsize-set  
Whether this tag affects the ellipsize mode

align-set  
Whether this tag affects the alignment mode

edited (arg0 <gchararray>)  
[Signal on <gtk-cell-renderer-text>]  
This signal is emitted after renderer has been edited.

gtk-cell-renderer-text-new ⇒ (ret <gtk-cell-renderer>)  
[Function]  
Creates a new <gtk-cell-renderer-text>. Adjust how text is drawn using object properties. Object properties can be set globally (with g-object-set). Also, with <gtk-tree-view-column>, you can bind a property to a value in a <gtk-tree-model>. For example, you can bind the "text" property on the cell renderer to a string value in the model, thus rendering a different string in each row of the <gtk-tree-view>

ret  
the new cell renderer
# 51 GtkCellRendererToggle

Renders a toggle button in a cell

## 51.1 Overview

<gtk-cell-renderer-toggle> renders a toggle button in a cell. The button is drawn as a radio- or checkbutton, depending on the radio property. When activated, it emits the toggled signal.

## 51.2 Usage

<gtk-cell-renderer-toggle> [Class]

Derives from <gtk-cell-renderer>. This class defines the following slots:

activatable
The toggle button can be activated

active
The toggle state of the button

radio
Draw the toggle button as a radio button

inconsistent
The inconsistent state of the button

indicator-size
Size of check or radio indicator

### toggled (arg0 <gchararray>) [Signal on <gtk-cell-renderer-toggle>]

The ::toggled signal is emitted when the cell is toggled.

### gtk-cell-renderer-toggle-new ⇒ (ret <gtk-cell-renderer>) [Function]

Creates a new <gtk-cell-renderer-toggle>. Adjust rendering parameters using object properties. Object properties can be set globally (with g-object-set). Also, with <gtk-tree-view-column>, you can bind a property to a value in a <gtk-tree-model>. For example, you can bind the "active" property on the cell renderer to a boolean value in the model, thus causing the check button to reflect the state of the model.

ret the new cell renderer

### gtk-cell-renderer-toggle-get-radio

(slef <gtk-cell-renderer-toggle>) ⇒ (ret bool) [Method]

Returns whether we’re rendering radio toggles rather than checkboxes.

ret ‘#t’ if we’re rendering radio toggles rather than checkboxes
Chapter 51: GtkCellRendererToggle

**gtk-cell-renderer-toggle-set-radio**

**set-radio**

If `radio` is `#t`, the cell renderer renders a radio toggle (i.e. a toggle in a group of mutually-exclusive toggles). If `#f`, it renders a check toggle (a standalone boolean option). This can be set globally for the cell renderer, or changed just before rendering each cell in the model (for `<gtk-tree-view>`, you set up a per-row setting using `<gtk-tree-view-column>` to associate model columns with cell renderer properties).

- `toggle` a `<gtk-cell-renderer-toggle>`
- `radio` `#t'` to make the toggle look like a radio button

**gtk-cell-renderer-toggle-get-active**

**get-active**

Returns whether the cell renderer is active. See `gtk-cell-renderer-toggle-set-active`.

- `toggle` a `<gtk-cell-renderer-toggle>`
- `ret` `#t'` if the cell renderer is active.

**gtk-cell-renderer-toggle-set-active**

**set-active**

Activates or deactivates a cell renderer.

- `toggle` a `<gtk-cell-renderer-toggle>`.
- `setting` the value to set.
52 GtkListStore

A list-like data structure that can be used with the

52.1 Overview

The `<gtk-list-store>` object is a list model for use with a `<gtk-tree-view>` widget. It implements the `<gtk-tree-model>` interface, and consequently, can use all of the methods available there. It also implements the `<gtk-tree-sortable>` interface so it can be sorted by the view. Finally, it also implements the tree drag and drop interfaces.

The `<gtk-list-store>` can accept most GObject types as a column type, though it can’t accept all custom types. Internally, it will keep a copy of data passed in (such as a string or a boxed pointer). Columns that accept `<gobject>`s are handled a little differently. The `<gtk-list-store>` will keep a reference to the object instead of copying the value. As a result, if the object is modified, it is up to the application writer to call `gtk-tree-model-row-changed` to emit the "row_changed" signal. This most commonly affects lists with `<gdk-pixbuf>`s stored.

```c
enum {
    COLUMN_STRING,
    COLUMN_INT,
    COLUMN_BOOLEAN,
    N_COLUMNS
};

{ GtkListStore *list_store;
  GtkTreePath *path;
  GtkTreeIter iter;
  gint i;

  list_store = gtk_list_store_new (N_COLUMNS,
      G_TYPE_STRING,
      G_TYPE_INT,
      G_TYPE_BOOLEAN);

  for (i = 0; i < 10; i++)
  {
      gchar *some_data;

      some_data = get_some_data (i);

      /* Add a new row to the model */
      gtk_list_store_append (list_store, &iter);
      gtk_list_store_set (list_store, &iter,
          COLUMN_STRING, some_data,
          COLUMN_INT, i,
```
COLUMN_BOOLEAN, FALSE, -1);

/* As the store will keep a copy of the string internally, we free some_data. */
g_free (some_data); }

/* Modify a particular row */
path = gtk_tree_path_new_from_string ("4");
gtk_tree_model_get_iter (GTK_TREE_MODEL (list_store), &iter,
       path);
gtk_tree_path_free (path);
gtk_list_store_set (list_store, &iter,
       COLUMN_BOOLEAN, TRUE, -1);
}

52.2 Performance Considerations

Internally, the <gtk-list-store> was implemented with a linked list with a tail pointer prior to GTK+ 2.6. As a result, it was fast at data insertion and deletion, and not fast at random data access. The <gtk-list-store> sets the <gtk-tree-model-iters-persist> flag, which means that <gtk-tree-iter>s can be cached while the row exists. Thus, if access to a particular row is needed often and your code is expected to run on older versions of GTK+, it is worth keeping the iter around.

It is important to note that only the methods gtk-list-store-insert-with-values and gtk-list-store-insert-with-valuesv are atomic, in the sense that the row is being appended to the store and the values filled in in a single operation with regard to <gtk-tree-model> signaling. In contrast, using e.g. gtk-list-store-append and then gtk-list-store-set will first create a row, which triggers the "row_inserted" <gtk-tree-model> signal on <gtk-list-store>. The row, however, is still empty, and any signal handler connecting to "row_inserted" on this particular store should be prepared for the situation that the row might be empty. This is especially important if you are wrapping the <gtk-list-store> inside a <gtk-tree-model-filter> and are using a <gtk-tree-model-filter-visible-func>. Using any of the non-atomic operations to append rows to the <gtk-list-store> will cause the <gtk-tree-model-filter-visible-func> to be visited with an empty row first; the function must be prepared for that.

52.3 Usage

<gtk-list-store> [Class]

This class defines no direct slots.
Chapter 52: GtkListStore

**gtk-list-store-new** *(types scm) ⇒ (ret <gtk-list-store>)* [Function]
Creates a new list store as with n-columns columns each of the types passed in. Note that only types derived from standard GObject fundamental types are supported.

As an example, `gtk_tree_store_new (3, G_TYPE_INT, G_TYPE_STRING, GDK_TYPE_PIXBUF);` will create a new `<gtk-list-store>` with three columns, of type int, string and `<gdk-pixbuf>` respectively.

n-columns number of columns in the list store

... all <g-type> types for the columns, from first to last

ret a new `<gtk-list-store>`

**gtk-list-store-set-value** *(self <gtk-list-store>) (iter <gtk-tree-iter>) (column int) (value scm)* [Function]

*set-value*
Sets the data in the cell specified by iter and column. The type of value must be convertible to the type of the column.

list-store A `<gtk-list-store>`

iter A valid `<gtk-tree-iter>` for the row being modified

column column number to modify

value new value for the cell

**gtk-list-store-remove** *(self <gtk-list-store>) (iter <gtk-tree-iter>) ⇒ (ret <gtk-tree-iter>)* [Function]

*remove*
Removes the given row from the list store. After being removed, iter is set to be the next valid row, or invalidated if it pointed to the last row in list-store.

list-store A `<gtk-list-store>`

iter A valid `<gtk-tree-iter>`

ret ‘#t’ if iter is valid, ‘#f’ if not.

**gtk-list-store-insert** *(self <gtk-list-store>) (position int) ⇒ (ret <gtk-tree-iter>)* [Function]

*insert*
Creates a new row at position. iter will be changed to point to this new row. If position is larger than the number of rows on the list, then the new row will be appended to the list. The row will be empty after this function is called. To fill in values, you need to call gtk-list-store-set or gtk-list-store-set-value.

list-store A `<gtk-list-store>`

iter An unset `<gtk-tree-iter>` to set to the new row

position position to insert the new row
Chapter 52: GtkListStore

**gtk-list-store-insert-before (self <gtk-list-store>)**

```
(sibling <gtk-tree-iter>) ⇒ (ret <gtk-tree-iter>)
```

**insert-before**

Inserts a new row before `sibling`. If `sibling` is `#f`, then the row will be appended to the end of the list. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-list-store-set` or `gtk-list-store-set-value`.

- **list-store**: A `<gtk-list-store>`
- **iter**: An unset `<gtk-tree-iter>` to set to the new row
- **sibling**: A valid `<gtk-tree-iter>`, or `'#f'

**gtk-list-store-insert-after (self <gtk-list-store>)**

```
(sibling <gtk-tree-iter>) ⇒ (ret <gtk-tree-iter>)
```

**insert-after**

Inserts a new row after `sibling`. If `sibling` is `#f`, then the row will be prepended to the beginning of the list. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-list-store-set` or `gtk-list-store-set-value`.

- **list-store**: A `<gtk-list-store>`
- **iter**: An unset `<gtk-tree-iter>` to set to the new row
- **sibling**: A valid `<gtk-tree-iter>`, or `'#f'

**gtk-list-store-prepend (self <gtk-list-store>)**

```
⇒ (ret <gtk-tree-iter>)
```

**prepend**

Prepends a new row to `list-store`. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-list-store-set` or `gtk-list-store-set-value`.

- **list-store**: A `<gtk-list-store>`
- **iter**: An unset `<gtk-tree-iter>` to set to the prepend row

**gtk-list-store-append (self <gtk-list-store>)**

```
⇒ (ret <gtk-tree-iter>)
```

**append**

Appends a new row to `list-store`. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-list-store-set` or `gtk-list-store-set-value`.

- **list-store**: A `<gtk-list-store>`
- **iter**: An unset `<gtk-tree-iter>` to set to the appended row

**gtk-list-store-clear (self <gtk-list-store>)**

```
⇒ (ret <gtk-tree-iter>)
```

**clear**

Removes all rows from the list store.

- **list-store**: A `<gtk-list-store>`.
gtk-list-store-iter-is-valid (self <gtk-list-store>)  [Function]
    (iter <gtk-tree-iter>) ⇒ (ret bool)

iter-is-valid  [Method]

Checks if the given iter is a valid iter for this <gtk-list-store>.

list-store  A <gtk-list-store>.
iter  A <gtk-tree-iter>.
ret  ‘#t’ if the iter is valid, ‘#f’ if the iter is invalid.

Since 2.2

gtk-list-store-reorder (self <gtk-list-store>)  [Function]
    ⇒ (new_order int)

reorder  [Method]

Reorders store to follow the order indicated by new-order. Note that this function
only works with unsorted stores.

store  A <gtk-list-store>.
new-order  an array of integers mapping the new position of each child to its old
position before the re-ordering, i.e. new-order'[newpos] = oldpos'.

Since 2.2

gtk-list-store-swap (self <gtk-list-store>)  [Function]
    (a <gtk-tree-iter>) (b <gtk-tree-iter>)

swap  [Method]

Swaps a and b in store. Note that this function only works with unsorted stores.

store  A <gtk-list-store>.
a  A <gtk-tree-iter>.
b  Another <gtk-tree-iter>.

Since 2.2

gtk-list-store-move-before (self <gtk-list-store>)  [Function]
    (iter <gtk-tree-iter>) (position <gtk-tree-iter>)

move-before  [Method]

Moves iter in store to the position before position. Note that this function only works
with unsorted stores. If position is ‘#f’, iter will be moved to the end of the list.

store  A <gtk-list-store>.
iter  A <gtk-tree-iter>.
position  A <gtk-tree-iter>, or ‘#f’.

Since 2.2
```markdown
**gtk-list-store-move-after (self <gtk-list-store>)**

* (iter <gtk-tree-iter>) (position <gtk-tree-iter>)

**move-after**

Moves *iter* in *store* to the position after *position*. Note that this function only works with unsorted stores. If *position* is `#f`, *iter* will be moved to the start of the list.

* store  A `<gtk-list-store>`.
* iter  A `<gtk-tree-iter>`.
* position  A `<gtk-tree-iter>` or `#f`.

Since 2.2
```
53 GtkTreeStore

A tree-like data structure that can be used with the

53.1 Overview

The `<gtk-tree-store>` object is a list model for use with a `<gtk-tree-view>` widget. It implements the `<gtk-tree-model>` interface, and consequently, can use all of the methods available there. It also implements the `<gtk-tree-sortable>` interface so it can be sorted by the view. Finally, it also implements the tree drag and drop interfaces.

53.2 Usage

```python
<gtk-tree-store>  # [Class]
    This class defines no direct slots.

gtk-tree-store-new (types scm) ⇒ (ret <gtk-tree-store>)  # [Function]
    Creates a new tree store as with n-columns columns each of the types passed in. Note that only types derived from standard GObject fundamental types are supported.
    As an example, `gtk_tree_store_new (3, G_TYPE_INT, G_TYPE_STRING, GDK_TYPE_PIXBUF);` will create a new `<gtk-tree-store>` with three columns, of type `<int>`, `<string>` and `<gdk-pixbuf>` respectively.

    n-columns   number of columns in the tree store
    ... all <g-type> types for the columns, from first to last
    ret         a new `<gtk-tree-store>`

gtk-tree-store-set-value (self <gtk-tree-store>)
    (iter <gtk-tree-iter>) (column int) (value scm)  # [Method]
    set-value
    Sets the data in the cell specified by iter and column. The type of value must be convertible to the type of the column.

    tree-store   a `<gtk-tree-store>`
    iter         A valid `<gtk-tree-iter>` for the row being modified
    column       column number to modify
    value        new value for the cell

gtk-tree-store-remove (self <gtk-tree-store>)
    (iter <gtk-tree-iter>) ⇒ (ret <gtk-tree-iter>)  # [Method]
    remove
    Removes iter from tree-store. After being removed, iter is set to the next valid row at that level, or invalidated if it previously pointed to the last one.

    tree-store   A `<gtk-tree-store>`
```
iter  A valid `<gtk-tree-iter>`

ret  ‘#t’ if iter is still valid, ‘#f’ if not.

gtk-tree-store-insert (self `<gtk-tree-store>`)  [Function]
  (parent `<gtk-tree-iter>`) (position int) ⇒ (ret `<gtk-tree-iter>`)  [Method]

insert  Creates a new row at position. If parent is non-‘#f’, then the row will be made a child of parent. Otherwise, the row will be created at the toplevel. If position is larger than the number of rows at that level, then the new row will be inserted to the end of the list. iter will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call gtk-tree-store-set or gtk-tree-store-set-value.

tree-store  A `<gtk-tree-store>`

iter  An unset `<gtk-tree-iter>` to set to the new row

parent  A valid `<gtk-tree-iter>`, or ‘#f’

position  position to insert the new row

gtk-tree-store-insert-before (self `<gtk-tree-store>`)  [Function]
  (parent `<gtk-tree-iter>`) (sibling `<gtk-tree-iter>`) ⇒ (ret `<gtk-tree-iter>`)  [Method]

insert-before  Inserts a new row before sibling. If sibling is ‘#f’, then the row will be appended to parent’s children. If parent and sibling are ‘#f’, then the row will be appended to the toplevel. If both sibling and parent are set, then parent must be the parent of sibling. When sibling is set, parent is optional.

iter will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call gtk-tree-store-set or gtk-tree-store-set-value.

tree-store  A `<gtk-tree-store>`

iter  An unset `<gtk-tree-iter>` to set to the new row

parent  A valid `<gtk-tree-iter>`, or ‘#f’

sibling  A valid `<gtk-tree-iter>`, or ‘#f’

gtk-tree-store-insert-after (self `<gtk-tree-store>`)  [Function]
  (parent `<gtk-tree-iter>`) (sibling `<gtk-tree-iter>`) ⇒ (ret `<gtk-tree-iter>`)  [Method]

insert-after  Inserts a new row after sibling. If sibling is ‘#f’, then the row will be prepended to parent’s children. If parent and sibling are ‘#f’, then the row will be prepended to the toplevel. If both sibling and parent are set, then parent must be the parent of sibling. When sibling is set, parent is optional.

iter will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call gtk-tree-store-set or gtk-tree-store-set-value.
Chapter 53: GtkTreeStore

**tree-store** A `<gtk-tree-store>`

**iter** An unset `<gtk-tree-iter>` to set to the new row

**parent** A valid `<gtk-tree-iter>`, or `'#f'`

**sibling** A valid `<gtk-tree-iter>`, or `'#f'`

### `gtk-tree-store-prepend` [Function]

```python
(gtk-tree-store-prepend (self <gtk-tree-store>) (parent <gtk-tree-iter>)) \Rightarrow (ret <gtk-tree-iter>)
```

**prepend** [Method]

Prepends a new row to `tree-store`. If `parent` is non-`'#f'`, then it will prepend the new row before the first child of `parent`, otherwise it will prepend a row to the top level. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-tree-store-set` or `gtk-tree-store-set-value`.

**tree-store** A `<gtk-tree-store>`

**iter** An unset `<gtk-tree-iter>` to set to the prepended row

**parent** A valid `<gtk-tree-iter>`, or `'#f'`

### `gtk-tree-store-append` [Function]

```python
(gtk-tree-store-append (self <gtk-tree-store>) (parent <gtk-tree-iter>)) \Rightarrow (ret <gtk-tree-iter>)
```

**append** [Method]

Appends a new row to `tree-store`. If `parent` is non-`'#f'`, then it will append the new row after the last child of `parent`, otherwise it will append a row to the top level. `iter` will be changed to point to this new row. The row will be empty after this function is called. To fill in values, you need to call `gtk-tree-store-set` or `gtk-tree-store-set-value`.

**tree-store** A `<gtk-tree-store>`

**iter** An unset `<gtk-tree-iter>` to set to the appended row

**parent** A valid `<gtk-tree-iter>`, or `'#f'`

### `gtk-tree-store-is-ancestor` [Function]

```python
(gtk-tree-store-is-ancestor (self <gtk-tree-store>) (iter <gtk-tree-iter>) (descendant <gtk-tree-iter>)) \Rightarrow (ret bool)
```

**is-ancestor** [Method]

Returns `'#t'` if `iter` is an ancestor of `descendant`. That is, `iter` is the parent (or grandparent or great-grandparent) of `descendant`.

**tree-store** A `<gtk-tree-store>`

**iter** A valid `<gtk-tree-iter>`

**descendant** A valid `<gtk-tree-iter>`

**ret** `'#t'`, if `iter` is an ancestor of `descendant`
gtk-tree-store-iter-depth (self <gtk-tree-store>) [Function]
  (iter <gtk-tree-iter>) ⇒ (ret int)

iter-depth [Method]
  Returns the depth of iter. This will be 0 for anything on the root level, 1 for anything
down a level, etc.

  tree-store A <gtk-tree-store>
  iter A valid <gtk-tree-iter>
  ret The depth of iter

gtk-tree-store-clear (self <gtk-tree-store>) [Function]
clear [Method]
  Removes all rows from tree-store

  tree-store A <gtk-tree-store>

gtk-tree-store-iter-is-valid (self <gtk-tree-store>) [Function]
  (iter <gtk-tree-iter>) ⇒ (ret bool)

iter-is-valid [Method]
  WARNING: This function is slow. Only use it for debugging and/or testing purposes.
  Checks if the given iter is a valid iter for this <gtk-tree-store>.

  tree-store A <gtk-tree-store>.
  iter A <gtk-tree-iter>.
  ret ‘#t’ if the iter is valid, ‘#f’ if the iter is invalid.

Since 2.2

gtk-tree-store-reorder (self <gtk-tree-store>) [Function]
  (parent <gtk-tree-iter>) ⇒ (new-order int)

reorder [Method]
  Reorders the children of parent in tree-store to follow the order indicated by new-order.
  Note that this function only works with unsorted stores.

  tree-store A <gtk-tree-store>.
  parent A <gtk-tree-iter>.
  new-order an array of integers mapping the new position of each child to its old
  position before the re-ordering, i.e. new-order‘[newpos] = oldpos’.

Since 2.2

gtk-tree-store-swap (self <gtk-tree-store>) [Function]
  (a <gtk-tree-iter>) (b <gtk-tree-iter>)

swap [Method]
  Swaps a and b in the same level of tree-store. Note that this function only works with
  unsorted stores.

  tree-store A <gtk-tree-store>.
  a A <gtk-tree-iter>.
Since 2.2

**gtk-tree-store-move-before** (self <gtk-tree-store>)

    (iter <gtk-tree-iter>) (position <gtk-tree-iter>)

**move-before**

Moves *iter* in *tree-store* to the position before *position*. *iter* and *position* should be in the same level. Note that this function only works with unsorted stores. If *position* is ‘#f’, *iter* will be moved to the end of the level.

- **tree-store** A <gtk-tree-store>.
- **iter** A <gtk-tree-iter>.
- **position** A <gtk-tree-iter> or ‘#f’.

Since 2.2

**gtk-tree-store-move-after** (self <gtk-tree-store>)

    (iter <gtk-tree-iter>) (position <gtk-tree-iter>)

**move-after**

Moves *iter* in *tree-store* to the position after *position*. *iter* and *position* should be in the same level. Note that this function only works with unsorted stores. If *position* is ‘#f’, *iter* will be moved to the start of the level.

- **tree-store** A <gtk-tree-store>.
- **iter** A <gtk-tree-iter>.
- **position** A <gtk-tree-iter>.

Since 2.2
54 GtkComboBox

A widget used to choose from a list of items

54.1 Overview

A `<gtk-combo-box>` is a widget that allows the user to choose from a list of valid choices. The `<gtk-combo-box>` displays the selected choice. When activated, the `<gtk-combo-box>` displays a popup which allows the user to make a new choice. The style in which the selected value is displayed, and the style of the popup is determined by the current theme. It may be similar to a `<gtk-option-menu>`, or similar to a Windows-style combo box.

Unlike its predecessors `<gtk-combo>` and `<gtk-option-menu>`, the `<gtk-combo-box>` uses the model-view pattern; the list of valid choices is specified in the form of a tree model, and the display of the choices can be adapted to the data in the model by using cell renderers, as you would in a tree view. This is possible since `<gtk-combo-box>` implements the `<gtk-cell-layout>` interface. The tree model holding the valid choices is not restricted to a flat list, it can be a real tree, and the popup will reflect the tree structure.

In addition to the model-view API, `<gtk-combo-box>` offers a simple API which is suitable for text-only combo boxes, and hides the complexity of managing the data in a model. It consists of the functions `gtk-combo-box-new-text`, `gtk-combo-box-append-text`, `gtk-combo-box-insert-text`, `gtk-combo-box-prepend-text`, `gtk-combo-box-remove-text` and `gtk-combo-box-get-active-text`.

54.2 Usage

`<gtk-combo-box>`

[Class]

Derives from `<gtk-cell-layout>`, `<gtk-cell-editable>`, `<gtk-bin>`.

This class defines the following slots:

- **model**
  - The model for the combo box

- **wrap-width**
  - Wrap width for laying out the items in a grid

- **row-span-column**
  - TreeModel column containing the row span values

- **column-span-column**
  - TreeModel column containing the column span values

- **active**
  - The item which is currently active

- **add-tearoffs**
  - Whether dropdowns should have a tearoff menu item

- **tearoff-title**
  - A title that may be displayed by the window manager when the popup is torn-off

- **has-frame**
  - Whether the combo box draws a frame around the child
**focus-on-click**
Whether the combo box grabs focus when it is clicked with the mouse

**popup-shown**
Whether the combo’s dropdown is shown

**changed**
[Signal on `<gtk-combo-box>`]
The changed signal is emitted when the active item is changed. The can be due to the user selecting a different item from the list, or due to a call to `gtk-combo-box-set-active-iter`. It will also be emitted while typing into a GtkComboBoxEntry, as well as when selecting an item from the GtkComboBoxEntry’s list.
Since 2.4

**move-active** *(arg0 `<gtk-scroll-type>*)
[Signal on `<gtk-combo-box>`]
undocumented

**popup**
[Signal on `<gtk-combo-box>`]
undocumented

**popdown ⇒ `<gboolean>`**
[Signal on `<gtk-combo-box>`]
undocumented

**gtk-combo-box-new ⇒ (ret `<gtk-widget>`)**
[Function]
Creates a new empty `<gtk-combo-box>`.

*ret* A new `<gtk-combo-box>`.
Since 2.4

**gtk-combo-box-new-with-model**(model `<gtk-tree-model>`) ⇒ (ret `<gtk-widget>`) 
[Function]
Creates a new `<gtk-combo-box>` with the model initialized to `model`.

*model* A `<gtk-tree-model>`.

*ret* A new `<gtk-combo-box>`.
Since 2.4

**gtk-combo-box-get-wrap-width**(self `<gtk-combo-box>`) ⇒ (ret `int`) 
[Method]
gets-wrap-width
Returns the wrap width which is used to determine the number of columns for the popup menu. If the wrap width is larger than 1, the combo box is in table mode.

*combo-box* A `<gtk-combo-box>`.

*ret* the wrap width.
Since 2.6
Chapter 54: GtkComboBox

**gtk-combo-box-set-wrap-width** (*self <gtk-combo-box>* (*width* int)) [Function]

**set-wrap-width** [Method]
Sets the wrap width of *combo-box* to be *width*. The wrap width is basically the preferred number of columns when you want the popup to be layed out in a table.

*combo-box*  
A *<gtk-combo-box>*.

*width*  
Preferred number of columns.

Since 2.4

**gtk-combo-box-get-row-span-column** (*self <gtk-combo-box>* ) [Function]
⇒ (*ret* int)

**get-row-span-column** [Method]
Returns the column with row span information for *combo-box*.

*combo-box*  
A *<gtk-combo-box>*.

*ret*  
The row span column.

Since 2.6

**gtk-combo-box-set-row-span-column** (*self <gtk-combo-box>* ) [Function]
(*row-span* int)

**set-row-span-column** [Method]
Sets the column with row span information for *combo-box* to be *row-span*. The row span column contains integers which indicate how many rows an item should span.

*combo-box*  
A *<gtk-combo-box>*.

*row-span*  
A column in the model passed during construction.

Since 2.4

**gtk-combo-box-get-active** (*self <gtk-combo-box>* ) ⇒ (*ret* int) [Function]

**get-active** [Method]
Returns the index of the currently active item, or -1 if there’s no active item. If the model is a non-flat treemodell, and the active item is not an immediate child of the root of the tree, this function returns ‘gtk_tree_path_get_indices (path) [0]’, where ‘path’ is the *<gtk-tree-path>* of the active item.

*combo-box*  
A *<gtk-combo-box>*.

*ret*  
An integer which is the index of the currently active item, or -1 if there’s no active item.

Since 2.4

**gtk-combo-box-set-active** (*self <gtk-combo-box>* ) (*index* int) [Function]

**set-active** [Method]
Sets the active item of *combo-box* to be the item at *index*. 
**combo-box**

A `<gtk-combo-box>`.

**index**

An index in the model passed during construction, or -1 to have no active item.

Since 2.4

```c
gtk-combo-box-get-active-iter (self <gtk-combo-box>)
    (iter <gtk-tree-iter>) ⇒ (ret bool)
```

**get-active-iter**

Sets `iter` to point to the current active item, if it exists.

```c
gtk-combo-box-set-active-iter (self <gtk-combo-box>)
    (iter <gtk-tree-iter>)
```

**set-active-iter**

Sets the current active item to be the one referenced by `iter`. `iter` must correspond to a path of depth one.

```c
gtk-combo-box-get-model (self <gtk-combo-box>)
⇒ (ret <gtk-tree-model>)
```

**get-model**

Returns the `<gtk-tree-model>` which is acting as data source for `combo-box`.

```c
gtk-combo-box-set-model (self <gtk-combo-box>)
    (model <gtk-tree-model>)
```

**set-model**

Sets the model used by `combo-box` to be `model`. Will unset a previously set model (if applicable). If model is `#f`, then it will unset the model.

Note that this function does not clear the cell renderers, you have to call `gtk-combo-box-cell-layout-clear` yourself if you need to set up different cell renderers for the new model.
**combo-box**
A `<gtk-combo-box>`.

**model**
A `<gtk-tree-model>`.

Since 2.4

**gtk-combo-box-new-text** ⇒ (ret `<gtk-widget>`)  
Convenience function which constructs a new text combo box, which is a `<gtk-combo-box>` just displaying strings. If you use this function to create a text combo box, you should only manipulate its data source with the following convenience functions: `gtk-combo-box-append-text`, `gtk-combo-box-insert-text`, `gtk-combo-box-prepend-text` and `gtk-combo-box-remove-text`.

**ret**
A new text combo box.

Since 2.4

**gtk-combo-box-append-text** (self `<gtk-combo-box>`) (text mchars)  
Appends string to the list of strings stored in `combo-box`. Note that you can only use this function with combo boxes constructed with `gtk-combo-box-new-text`.

**combo-box**
A `<gtk-combo-box>` constructed using `gtk-combo-box-new-text`.

**text**
A string.

Since 2.4

**gtk-combo-box-insert-text** (self `<gtk-combo-box>`) (position int) (text mchars)  
Inserts string at position in the list of strings stored in `combo-box`. Note that you can only use this function with combo boxes constructed with `gtk-combo-box-new-text`.

**combo-box**
A `<gtk-combo-box>` constructed using `gtk-combo-box-new-text`.

**position**
An index to insert text.

**text**
A string.

Since 2.4

**gtk-combo-box-prepend-text** (self `<gtk-combo-box>`) (text mchars)  
Prepends string to the list of strings stored in `combo-box`. Note that you can only use this function with combo boxes constructed with `gtk-combo-box-new-text`.

**combo-box**
A `<gtk-combo-box>` constructed with `gtk-combo-box-new-text`.

**text**
A string.

Since 2.4
**gtk-combo-box-remove-text** *(self <gtk-combo-box>)(position int)*  
[Function]

**remove-text**  
[Method]

Removes the string at *position* from *combo-box*. Note that you can only use this function with combo boxes constructed with *gtk-combo-box-new-text*.

*combo-box*

A `<gtk-combo-box>` constructed with `gtk-combo-box-new-text`.

*position*

Index of the item to remove.

Since 2.4

**gtk-combo-box-get-active-text** *(self <gtk-combo-box>)*  
[Function]

⇒ *(ret mchars)*

**get-active-text**  
[Method]

Returns the currently active string in *combo-box* or ‘#f’ if none is selected. Note that you can only use this function with combo boxes constructed with `gtk-combo-box-new-text` and with `<gtk-combo-box-entry>`s.

*combo-box*

A `<gtk-combo-box>` constructed with `gtk-combo-box-new-text`.

*ret*

A newly allocated string containing the currently active text.

Since 2.6

**gtk-combo-box-popup** *(self <gtk-combo-box>)*  
[Function]

**popup**  
[Method]

Pops up the menu or dropdown list of *combo-box*.

This function is mostly intended for use by accessibility technologies; applications should have little use for it.

*combo-box*

A `<gtk-combo-box>`

Since 2.4

**gtk-combo-box-popdown** *(self <gtk-combo-box>)*  
[Function]

**popdown**  
[Method]

Hides the menu or dropdown list of *combo-box*.

This function is mostly intended for use by accessibility technologies; applications should have little use for it.

*combo-box*

A `<gtk-combo-box>`

Since 2.4

**gtk-combo-box-get-popup-accessible** *(self <gtk-combo-box>)*  
[Function]

⇒ *(ret <atk-object>)*

**get-popup-accessible**  
[Method]

Gets the accessible object corresponding to the combo box’s popup.

This function is mostly intended for use by accessibility technologies; applications should have little use for it.
Chapter 54: GtkComboBox

combo-box

a <gtk-combo-box>

ret the accessible object corresponding to the combo box’s popup.

Since 2.6

gtk-combo-box-set-add-tearoffs (self <gtk-combo-box>) (add-tearoffs bool) [Function]
set-add-tearoffs [Method]
Sets whether the popup menu should have a tearoff menu item.

combo-box

a <gtk-combo-box>

add-tearoffs

‘#t’ to add tearoff menu items

Since 2.6

gtk-combo-box-get-add-tearoffs (self <gtk-combo-box>) ⇒ (ret bool) [Function]
get-add-tearoffs [Method]
Gets the current value of the :add-tearoffs property.

combo-box

a <gtk-combo-box>

ret the current value of the :add-tearoffs property.

gtk-combo-box-set-title (self <gtk-combo-box>) (title mchars) [Function]
set-title [Method]
Sets the menu’s title in tearoff mode.

combo-box

a <gtk-combo-box>

title a title for the menu in tearoff mode.

Since 2.10

gtk-combo-box-get-title (self <gtk-combo-box>) ⇒ (ret mchars) [Function]
get-title [Method]
Gets the current title of the menu in tearoff mode. See gtk-combo-box-set-add-tearoffs.

combo-box

a <gtk-combo-box>

ret the menu’s title in tearoff mode. This is an internal copy of the string which must not be freed.

Since 2.10

```haskell
gtk-combo-box-set-focus-on-click (self <gtk-combo-box>) (focus_on_click bool)

set-focus-on-click
Sets whether the combo box will grab focus when it is clicked with the mouse. Making
mouse clicks not grab focus is useful in places like toolbars where you don’t want the
keyboard focus removed from the main area of the application.

combo    a <gtk-combo-box>
focus-on-click
 whether the combo box grabs focus when clicked with the mouse

Since 2.6
```

```haskell
gtk-combo-box-get-focus-on-click (self <gtk-combo-box>) ⇒ (ret bool)

get-focus-on-click
Returns whether the combo box grabs focus when it is clicked with the mouse. See
gtk-combo-box-set-focus-on-click.

combo    a <gtk-combo-box>
ret    ‘#t’ if the combo box grabs focus when it is clicked with the mouse.

Since 2.6
```
55 GtkComboBoxEntry

A text entry field with a dropdown list

55.1 Overview

A `<gtk-combo-box-entry>` is a widget that allows the user to choose from a list of valid choices or enter a different value. It is very similar to a `<gtk-combo-box>`, but it displays the selected value in an entry to allow modifying it.

In contrast to a `<gtk-combo-box>`, the underlying model of a `<gtk-combo-box-entry>` must always have a text column (see `gtk-combo-box-entry-set-text-column`), and the entry will show the content of the text column in the selected row. To get the text from the entry, use `gtk-combo-box-entry-get-active-text`.

The changed signal will be emitted while typing into a GtkComboBoxEntry, as well as when selecting an item from the GtkComboBoxEntry’s list. Use `gtk-combo-box-entry-get-active` or `gtk-combo-box-entry-get-active-iter` to discover whether an item was actually selected from the list.

Connect to the activate signal of the GtkEntry (use `gtk-bin-get-child`) to detect when the user actually finishes entering text.

The convenience API to construct simple text-only `<gtk-combo-box>`es can also be used with `<gtk-combo-box-entry>`s which have been constructed with `gtk-combo-box-entry-new-text`.

55.2 Usage

```plaintext
<gtk-combo-box-entry> [Class]
   Derives from `<gtk-combo-box>`.
   This class defines the following slots:
      text-column
         A column in the data source model to get the strings from

gtk-combo-box-entry-new ⇒ (ret <gtk-widget>)  [Function]
   Creates a new `<gtk-combo-box-entry>` which has a `<gtk-entry>` as child. After construction, you should set a model using `gtk-combo-box-set-model` and a text_column * using `gtk-combo-box-entry-set-text-column`.
   ret      A new `<gtk-combo-box-entry>`.

Since 2.4

gtk-combo-box-entry-new-with-model (model <gtk-tree-model>) ⇒ (ret <gtk-widget>)  [Function]
   (text_column int) ⇒ (ret <gtk-widget>)
   Creates a new `<gtk-combo-box-entry>` which has a `<gtk-entry>` as child and a list of strings as popup. You can get the `<gtk-entry>` from a `<gtk-combo-box-entry>` using GTK_ENTRY (GTK_BIN (combo_box_entry)→child). To add and remove strings from the list, just modify `model` using its data manipulation API.
   model    A `<gtk-tree-model>`.
```
text-column
A column in model to get the strings from.
ret
A new `<GTK-COMBO-BOX-ENTRY>`.
Since 2.4

`GTK-COMBO-BOX-ENTRY-NEW-TEXT` ⇒ (`ret` `<GTK-WIDGET>`) [Function]
Convenience function which constructs a new editable text combo box, which is a
`GTK-COMBO-BOX-ENTRY` just displaying strings. If you use this function to cre-
ate a text combo box, you should only manipulate its data source with the follow-
ing convenience functions: `GTK-COMBO-BOX-APPEND-TEXT`, `GTK-COMBO-BOX-INSERT-
text`, `GTK-COMBO-BOX-PREPEND-TEXT` and `GTK-COMBO-BOX-REMOVE-TEXT`.
ret
A new text `<GTK-COMBO-BOX-ENTRY>`.
Since 2.4

`GTK-COMBO-BOX-ENTRY-SET-TEXT-COLUMN` [Function]

(set `self` `<GTK-COMBO-BOX-ENTRY>` (`text_column` `int`)
set-text-column [Method]
Sets the model column which `entry-box` should use to get strings from to be `text-
column`.

entry-box A `<GTK-COMBO-BOX-ENTRY>`.

text-column
A column in model to get the strings from.
Since 2.4

`GTK-COMBO-BOX-ENTRY-GET-TEXT-COLUMN` [Function]

(set `self` `<GTK-COMBO-BOX-ENTRY>` ⇒ (`ret` `int`)
get-text-column [Method]
Returns the column which `entry-box` is using to get the strings from.

entry-box A `<GTK-COMBO-BOX-ENTRY>`.

ret
A column in the data source model of `entry-box`.
Since 2.4
56 GtkMenu

A menu widget

56.1 Overview

A `<gtk-menu>` is a `<gtk-menu-shell>` that implements a drop down menu consisting of a list of `<gtk-menu-item>` objects which can be navigated and activated by the user to perform application functions.

A `<gtk-menu>` is most commonly dropped down by activating a `<gtk-menu-item>` in a `<gtk-menu-bar>` or popped up by activating a `<gtk-menu-item>` in another `<gtk-menu>`.

A `<gtk-menu>` can also be popped up by activating a `<gtk-option-menu>`. Other composite widgets such as the `<gtk-notebook>` can pop up a `<gtk-menu>` as well.

Applications can display a `<gtk-menu>` as a popup menu by calling the `gtk-menu-popup` function. The example below shows how an application can pop up a menu when the 3rd mouse button is pressed.

```c
/* connect our handler which will popup the menu */
g_signal_connect_swapped (window, "button_press_event",
G_CALLBACK (my_popup_handler), menu);

static gint
my_popup_handler (GtkWidget *widget, GdkEvent *event)
{
  GtkWidget *menu;
  GdkEventButton *event_button;
  g_return_val_if_fail (widget != NULL, FALSE);
  g_return_val_if_fail (GTK_IS_MENU (widget), FALSE);
  g_return_val_if_fail (event != NULL, FALSE);
  /* The "widget" is the menu that was supplied when */
  /* g_signal_connect_swapped() was called. */
  menu = GTK_MENU (widget);
  if (event->type == GDK_BUTTON_PRESS)
    {
      event_button = (GdkEventButton *) event;
      if (event_button->button == 3)
        {
          gtk_menu_popup (menu, NULL, NULL, NULL, NULL,
          event_button->button, event_button->time);
          return TRUE;
        }
    }
}
```
return FALSE;
}

## 56.2 Usage

<gtk-menu>  
[Class]
Derives from <gtk-menu-shell>.
This class defines the following slots:

* tearoff-state  
A boolean that indicates whether the menu is torn-off

* tearoff-title  
A title that may be displayed by the window manager when this menu is torn-off

move-scroll (arg0 <gtk-scroll-type>)  
[Signal on <gtk-menu>]

gtk-menu-new ⇒ (ret <gtk-widget>)  
[Function]
Creates a new <gtk-menu>.

set-screen (self <gtk-menu>) (screen <gdk-screen>)  
[Function]
Sets the <gdk-screen> on which the menu will be displayed.

* menu  
a <gtk-menu>.

* screen  
a <gdk-screen>, or ‘#f’ if the screen should be determined by the widget the menu is attached to.

Since 2.2

gtk-menu-reorder-child (self <gtk-menu>) (child <gtk-widget>) (position int)  
[Function]
reorder-child  
[Method]
Moves a <gtk-menu-item> to a new position within the <gtk-menu>.

* menu  
a <gtk-menu>.

* child  
the <gtk-menu-item> to move.

* position  
the new position to place child. Positions are numbered from 0 to n-1.

gtk-menu-attach (self <gtk-menu>) (child <gtk-widget>) (left_attach unsigned-int) (right_attach unsigned-int) (top_attach unsigned-int) (bottom_attach unsigned-int)  
[Function]
attach  
[Method]
Adds a new <gtk-menu-item> to a (table) menu. The number of 'cells' that an item will occupy is specified by left-attach, right-attach, top-attach and bottom-attach. These each represent the leftmost, rightmost, uppermost and lower column and row numbers of the table. (Columns and rows are indexed from zero).
Note that this function is not related to gtk-menu-detach.
Chapter 56: GtkMenu

menu   a <gtk-menu>.
child  a <gtk-menu-item>.
left-attach The column number to attach the left side of the item to.
right-attach The column number to attach the right side of the item to.
top-attach The row number to attach the top of the item to.
bottom-attach The row number to attach the bottom of the item to.

Since 2.4

```
gtk-menu-popup (self <gtk-menu>) (parent_menu_shell <gtk-widget>) [Function]
       (parent_menu_item <gtk-widget>) (menu_position_func scm)
       (button unsigned-int) (activate_time unsigned-int32)
```

popup [Method]
Displays a menu and makes it available for selection. Applications can use this function to display context-sensitive menus, and will typically supply ‘#f’ for the parent-menu-shell, parent-menu-item, func and data parameters. The default menu positioning function will position the menu at the current mouse cursor position.

The button parameter should be the mouse button pressed to initiate the menu popup. If the menu popup was initiated by something other than a mouse button press, such as a mouse button release or a keypress, button should be 0.

The activate-time parameter should be the time stamp of the event that initiated the popup. If such an event is not available, use gtk-current-event-time instead.

```
menu   a <gtk-menu>.
parent-menu-shell the menu shell containing the triggering menu item, or ‘#f’
parent-menu-item the menu item whose activation triggered the popup, or ‘#f’
func    a user supplied function used to position the menu, or ‘#f’
data    user supplied data to be passed to func.
button  the mouse button which was pressed to initiate the event.
activate-time the time at which the activation event occurred.
```

```
gtk-menu-set-accel-group (self <gtk-menu>) [Function]
       (accel_group <gtk-accel-group>)
```

```
set-accel-group [Method]
Set the <gtk-accel-group> which holds global accelerators for the menu. This accelerator group needs to also be added to all windows that this menu is being used in with gtk-window-add-accel-group, in order for those windows to support all the accelerators contained in this group.
```
menu a <gtk-menu>.

accel-group

the <gtk-accel-group> to be associated with the menu.

```sloppy

[Function]
gtk-menu-get-accel-group (self <gtk-menu>) ⇒ (ret <gtk-accel-group>)

get-accel-group

Gets the <gtk-accel-group> which holds global accelerators for the menu. See gtk-menu-set-accel-group.

menu a <gtk-menu>.

ret the <gtk-accel-group> associated with the menu.
```

```sloppy

[Function]
gtk-menu-set-accel-path (self <gtk-menu>) (accel_path mchars)

set-accel-path

Sets an accelerator path for this menu from which accelerator paths for its immediate children, its menu items, can be constructed. The main purpose of this function is to spare the programmer the inconvenience of having to call gtk-menu-item-set-accel-path on each menu item that should support runtime user changeable accelerators. Instead, by just calling gtk-menu-set-accel-path on their parent, each menu item of this menu, that contains a label describing its purpose, automatically gets an accel path assigned. For example, a menu containing menu items "New" and "Exit", will, after 'gtk_menu_set_accel_path (menu, "<Gnumeric-Sheet>/File");' has been called, assign its items the accel paths: '<"Gnumeric-Sheet>/File/Exit"'. Assigning accel paths to menu items then enables the user to change their accelerators at runtime. More details about accelerator paths and their default setups can be found at gtk-accel-map-add-entry.

menu a valid <gtk-menu>

accel-path a valid accelerator path

```sloppy

[Function]
gtk-menu-set-title (self <gtk-menu>) (title mchars)

set-title

Sets the title string for the menu. The title is displayed when the menu is shown as a tearoff menu. If title is '#f', the menu will see if it is attached to a parent menu item, and if so it will try to use the same text as that menu item’s label.

menu a <gtk-menu>

title a string containing the title for the menu.

```sloppy

[Function]
gtk-menu-get-tearoff-state (self <gtk-menu>) ⇒ (ret bool)

get-tearoff-state

Returns whether the menu is torn off. See gtk-menu-set-tearoff-state.

menu a <gtk-menu>

ret ‘#t’ if the menu is currently torn off.
Chapter 56: GtkMenu

gtk-menu-get-title (self <gtk-menu>) ⇒ (ret mchars)  [Function]
get-title
Returns the title of the menu. See gtk-menu-set-title.
  menu a <gtk-menu>
  ret the title of the menu, or ‘#f’ if the menu has no title set on it. This string
  is owned by the widget and should not be modified or freed.

gtk-menu-popdown (self <gtk-menu>)  [Function]
popdown
Removes the menu from the screen.
  menu a <gtk-menu>.

gtk-menu-reposition (self <gtk-menu>)  [Function]
reposition
Repositions the menu according to its position function.
  menu a <gtk-menu>.

gtk-menu-get-active (self <gtk-menu>) ⇒ (ret <gtk-widget>)  [Function]
get-active
Returns the selected menu item from the menu. This is used by the <gtk-option-
  menu>.
  menu a <gtk-menu>.
  ret the <gtk-menu-item> that was last selected in the menu. If a selection
  has not yet been made, the first menu item is selected.

gtk-menu-set-active (self <gtk-menu>) (index unsigned-int)  [Function]
set-active
Selects the specified menu item within the menu. This is used by the <gtk-option-
  menu> and should not be used by anyone else.
  menu a <gtk-menu>.
  index the index of the menu item to select. Index values are from 0 to n-1.

gtk-menu-set-tearoff-state (self <gtk-menu>) (torn_off bool)  [Function]
set-tearoff-state
Changes the tearoff state of the menu. A menu is normally displayed as drop down
menu which persists as long as the menu is active. It can also be displayed as a tearoff
menu which persists until it is closed or reattached.
  menu a <gtk-menu>.
  torn-off If ‘#t’, menu is displayed as a tearoff menu.

gtk-menu-detach (self <gtk-menu>)  [Function]
detach
Detaches the menu from the widget to which it had been attached. This function will
call the callback function, detacher, provided when the gtk-menu-attach-to-widget
function was called.
  menu a <gtk-menu>.
**gtk-menu-get-attach-widget** *(self <gtk-menu>)*  
⇒ (*ret* <gtk-widget>)*

**get-attach-widget**  
Returns the <gtk-widget> that the menu is attached to.

*menu* a <gtk-menu>.
*ret* the <gtk-widget> that the menu is attached to.

**gtk-menu-get-for-attach-widget** *(widget <gtk-widget>)*  
⇒ (*ret* glist-of)

Returns a list of the menus which are attached to this widget. This list is owned by GTK+ and must not be modified.

*widget* a <gtk-widget>.
*ret* the list of menus attached to this widget.

Since 2.6

**gtk-menu-set-monitor** *(self <gtk-menu>) (monitor_num int)*  
⇒ *()

**set-monitor**  
Informs GTK+ on which monitor a menu should be popped up. See gdk-screen-get-monitor-geometry.

This function should be called from a <gdk-menu-position-func> if the menu should not appear on the same monitor as the pointer. This information can't be reliably inferred from the coordinates returned by a <gdk-menu-position-func>, since, for very long menus, these coordinates may extend beyond the monitor boundaries or even the screen boundaries.

*menu* a <gtk-menu>

*monitor-num* the number of the monitor on which the menu should be popped up

Since 2.4
57 GtkMenuBar

A subclass widget for which holds widgets

57.1 Overview

The `<gtk-menu-bar>` is a subclass of `<gtk-menu-shell>` which contains one to many `<gtk-menu-item>`. The result is a standard menu bar which can hold many menu items. `<gtk-menu-bar>` allows for a shadow type to be set for aesthetic purposes. The shadow types are defined in the `<gtk-menu-bar-set-shadow-type>` function.

57.2 Usage

```plaintext
<gtk-menu-bar>
   [Class]
   Derives from `<gtk-menu-shell>`. This class defines the following slots:
   pack-direction
      The pack direction of the menubar
   child-pack-direction
      The child pack direction of the menubar

   gtk-menu-bar-new ⇒ (ret `<gtk-widget>`) [Function]
      Creates the new `<gtk-menu-bar>`
   ret the `<gtk-menu-bar>`

   gtk-menu-bar-set-pack-direction (self `<gtk-menu-bar>`) [Function]
      (pack_dir `<gtk-pack-direction>`) set-pack-direction
      Sets how items should be packed inside a menubar.
   menubar a `<gtk-menu-bar>`.
   pack-dir a new `<gtk-pack-direction>`.
   Since 2.8

   gtk-menu-bar-get-pack-direction (self `<gtk-menu-bar>`) [Function]
      ⇒ (ret `<gtk-pack-direction>`) get-pack-direction
      Retrieves the current pack direction of the menubar. See `gtk-menu-bar-set-pack-direction`.
   menubar a `<gtk-menu-bar>`
   ret the pack direction
   Since 2.8
```
58 GtkMenuItem

The widget used for item in menus

58.1 Overview

The `<gtk-menu-item>` widget and the derived widgets are the only valid childs for menus. Their function is to correctly handle highlighting, alignment, events and submenus.

As it derives from `<gtk-bin>` it can hold any valid child widget, although only a few are really useful.

58.2 Usage

`<gtk-menu-item>`

[Class]

Derives from `<gtk-item>`.

This class defines the following slots:

- `submenu` The submenu attached to the menu item, or NULL if it has none

- `activate` [Signal on `<gtk-menu-item>`]
  
  Emitted when the item is activated.

- `activate-item` [Signal on `<gtk-menu-item>`]
  
  Emitted when the item is activated, but also if the menu item has a submenu. For normal applications, the relevant signal is "activate".

- `toggle-size-request (arg0 <gpointer> )` [Signal on `<gtk-menu-item>`]

- `toggle-size-allocate (arg0 <gint> )` [Signal on `<gtk-menu-item>`]

- `gtk-menu-item-new ⇒ (ret <gtk-widget>)` [Function]
  
  Creates a new `<gtk-menu-item>`.

- `gtk-menu-item-new-with-label (label mchars)` [Function]

  Creates a new `<gtk-menu-item>` whose child is a `<gtk-label>`.

  - `label` the text for the label
  - `ret` the newly created `<gtk-menu-item>`

- `gtk-menu-item-new-with-mnemonic (label mchars)` [Function]

  Creates a new `<gtk-menu-item>` containing a label. The label will be created using `gtk-label-new-with-mnemonic`, so underscores in `label` indicate the mnemonic for the menu item.

  - `label` The text of the button, with an underscore in front of the mnemonic character
  - `ret` a new `<gtk-menu-item>`
gtk-menu-item-set-right-justified (self <gtk-menu-item>) [Function]
  (right_justified bool)

set-right-justified [Method]
  Sets whether the menu item appears justified at the right side of a menu bar. This was traditionally done for "Help" menu items, but is now considered a bad idea. (If the widget layout is reversed for a right-to-left language like Hebrew or Arabic, right-justified-menu-items appear at the left.)

  menu-item
    a <gtk-menu-item>.

right-justified
  if ‘#t’ the menu item will appear at the far right if added to a menu bar.

gtk-menu-item-set-submenu (self <gtk-menu-item>) [Function]
  (submenu <gtk-widget>)

set-submenu [Method]
  Sets the widget submenu, or changes it.

  menu-item
    the menu item widget

  submenu
    the submenu

gtk-menu-item-set-accel-path (self <gtk-menu-item>) [Function]
  (accel_path mchars)

set-accel-path [Method]
  Set the accelerator path on menu-item, through which runtime changes of the menu item’s accelerator caused by the user can be identified and saved to persistant storage (see gtk-accel-map-save on this). To setup a default accelerator for this menu item, call gtk-accel-map-add-entry with the same accel-path. See also gtk-accel-map-add-entry on the specifics of accelerator paths, and gtk-menu-set-accel-path for a more convenient variant of this function.

  This function is basically a convenience wrapper that handles calling gtk-widget-set-accel-path with the appropriate accelerator group for the menu item.

  Note that you do need to set an accelerator on the parent menu with gtk-menu-set-accel-group for this to work.

  menu-item
    a valid <gtk-menu-item>

  accel-path
    acceleration path, corresponding to this menu item’s functionality, or ‘#f’ to unset the current path.

gtk-menu-item-remove-submenu (self <gtk-menu-item>) [Function]
remove-submenu [Method]
  Removes the widget’s submenu.

  menu-item
    the menu item widget
**gtk-menu-item-select** (*self <gtk-menu-item>*)  
[Function]

*select*  
[Method]

Emits the "select" signal on the given item. Behaves exactly like `<gtk-item-select>`.

*menu-item*  
the menu item

**gtk-menu-item-deselect** (*self <gtk-menu-item>*)  
[Function]

deselect  
[Method]

Emits the "deselect" signal on the given item. Behaves exactly like `<gtk-item-deselect>`.

*menu-item*  
the menu item

**gtk-menu-item-activate** (*self <gtk-menu-item>*)  
[Function]

activate  
[Method]

Emits the "activate" signal on the given item

*menu-item*  
the menu item

**gtk-menu-item-toggle-size-request** (*self <gtk-menu-item>*)  
[Function]

⇒ (*requisition* int)

toggle-size-request  
[Method]

Emits the "toggle_size_request" signal on the given item.

*menu-item*  
the menu item

*requisition*  
the requisition to use as signal data.

**gtk-menu-item-toggle-size-allocate** (*self <gtk-menu-item>*)  
[Function]

(allocation int)
toggle-size-allocate  
[Method]

Emits the "toggle_size_allocate" signal on the given item.

*menu-item*  
the menu item.

*allocation*  
the allocation to use as signal data.

**gtk-menu-item-get-right-justified** (*self <gtk-menu-item>*)  
[Function]

⇒ (*ret* bool)
get-right-justified  
[Method]

Gets whether the menu item appears justified at the right side of the menu bar.

*menu-item*  
a <gtk-menu-item>

*ret*  
‘#t’ if the menu item will appear at the far right if added to a menu bar.
gtk-menu-item-get-submenu (self <gtk-menu-item>) ⇒ (ret <gtk-widget>)

get-submenu

Gets the submenu underneath this menu item, if any. See gtk-menu-item-set-submenu.

menu-item

a <gtk-menu-item>

ret submenu for this menu item, or ‘#f’ if none.
Chapter 59: GtkMenuShell

A base class for menu objects

59.1 Overview

A `<gtk-menu-shell>` is the abstract base class used to derive the `<gtk-menu>` and `<gtk-menu-bar>` subclasses.

A `<gtk-menu-shell>` is a container of `<gtk-menu-item>` objects arranged in a list which can be navigated, selected, and activated by the user to perform application functions. A `<gtk-menu-item>` can have a submenu associated with it, allowing for nested hierarchical menus.

59.2 Usage

```plaintext
<gtk-menu-shell>
   Derives from `<gtk-container>`.

   This class defines the following slots:

   take-focus
     A boolean that determines whether the menu grabs the keyboard focus

   deactivate
     [Signal on `<gtk-menu-shell>`]
     This signal is emitted when a menu shell is deactivated.

   selection-done
     [Signal on `<gtk-menu-shell>`]
     This signal is emitted when a selection has been completed within a menu shell.

   move-current
     [Signal on `<gtk-menu-shell>`]
     (arg0 `<gtk-menu-direction-type>`)  
     An action signal which moves the current menu item in the direction specified by direction.

   activate-current (arg0 `<gboolean>`)  
     [Signal on `<gtk-menu-shell>`]
     An action signal that activates the current menu item within the menu shell.

   cancel
     [Signal on `<gtk-menu-shell>`]
     An action signal which cancels the selection within the menu shell. Causes the GtkMenuShell::selection-done signal to be emitted.

   cycle-focus (arg0 `<gtk-direction-type>`)  
   move-selected (arg0 `<gint>`) ⇒ `<gboolean>`  
     [Signal on `<gtk-menu-shell>`]
     undocumented

   gtk-menu-shell-append (self `<gtk-menu-shell>`)  
     (child `<gtk-widget>`)  
     [Function]
     append
      Adds a new `<gtk-menu-item>` to the end of the menu shell’s item list.
```
menu-shell
   a <gtk-menu-shell>.
child   The <gtk-menu-item> to add.

gtk-menu-shell-prepend (self <gtk-menu-shell>) [Function]
   (child <gtk-widget>) [Method]
prepend
   Adds a new <gtk-menu-item> to the beginning of the menu shell’s item list.

   menu-shell
   a <gtk-menu-shell>.
child   The <gtk-menu-item> to add.

gtk-menu-shell-insert (self <gtk-menu-shell>) [Function]
   (child <gtk-widget>) (position int) [Method]
insert
   Adds a new <gtk-menu-item> to the menu shell’s item list at the position indicated
   by position.

   menu-shell
   a <gtk-menu-shell>.
child   The <gtk-menu-item> to add.
position   The position in the item list where child is added. Positions are numbered
   from 0 to n-1.

gtk-menu-shell-deactivate (self <gtk-menu-shell>) [Function]
deactivate [Method]
   Deactivates the menu shell. Typically this results in the menu shell being erased from
   the screen.

   menu-shell
   a <gtk-menu-shell>.

gtk-menu-shell-select-item (self <gtk-menu-shell>) [Function]
   (menu_item <gtk-widget>) [Method]
select-item
   Selects the menu item from the menu shell.

   menu-shell
   a <gtk-menu-shell>.
menu-item
   The <gtk-menu-item> to select.

gtk-menu-shell-select-first (self <gtk-menu-shell>) [Function]
   (search_sensitive bool) [Method]
select-first
   Select the first visible or selectable child of the menu shell; don’t select tearoff items
   unless the only item is a tearoff item.
search-sensitive
if ‘#t’, search for the first selectable menu item, otherwise select nothing
if the first item isn’t sensitive. This should be ‘#f’ if the menu is being
popped up initially.

Since 2.2

```python
gtk-menu-shell-deselect (self <gtk-menu-shell>)
```

Deselects the currently selected item from the menu shell, if any.

```python
gtk-menu-shell-activate-item (self <gtk-menu-shell>)
(menu_item <gtk-widget>) (force_deactivate bool)
```

Activates the menu item within the menu shell.

```python
gtk-menu-shell-cancel (self <gtk-menu-shell>)
```

Cancels the selection within the menu shell.

```python
gtk-menu-shell-set-take-focus (self <gtk-menu-shell>)
(take_focus bool)
```

If `take-focus` is ‘#t’ (the default) the menu shell will take the keyboard focus so that
it will receive all keyboard events which is needed to enable keyboard navigation in
menus.

Setting `take-focus` to ‘#f’ is useful only for special applications like virtual keyboard
implementations which should not take keyboard focus.

The `take-focus` state of a menu or menu bar is automatically propagated to submenus
whenever a submenu is popped up, so you don’t have to worry about recursively
setting it for your entire menu hierarchy. Only when programmatically picking a
submenu and popping it up manually, the *take-focus* property of the submenu needs
to be set explicitly.
Note that setting it to ‘#f’ has side-effects:
If the focus is in some other app, it keeps the focus and keynav in the menu doesn’t
work. Consequently, keynav on the menu will only work if the focus is on some
toplevel owned by the onscreen keyboard.
To avoid confusing the user, menus with *take-focus* set to ‘#f’ should not display
mnemonics or accelerators, since it cannot be guaranteed that they will work.
See also gdk-keyboard-grab

```c
menu-shell
    a <gtk-menu-shell>
    take-focus ‘#t’ if the menu shell should take the keyboard focus on popup.
```

Since 2.8

```c
gtk-menu-shell-get-take-focus (self <gtk-menu-shell>) [Function]
    ⇒ (ret bool)
get-take-focus
    Returns ‘#t’ if the menu shell will take the keyboard focus on popup.
```

```c
menu-shell
    a <gtk-menu-shell>
    ret ‘#t’ if the menu shell will take the keyboard focus on popup.
```

Since 2.8
Chapter 60: GtkImageMenuItem

A menu item with an icon

60.1 Overview
A GtkImageMenuItem is a menu item which has an icon next to the text label.

Note that the user can disable display of menu icons, so make sure to still fill in the text label.

60.2 Usage

```xml
<gtk-image-menu-item>
Derives from <gtk-menu-item>.
This class defines the following slots:
image Child widget to appear next to the menu text

gtk-image-menu-item-set-image (self <gtk-image-menu-item>)
(image <gtk-widget>)
set-image
Sets the image of image-menu-item to the given widget. Note that it depends on the
show-menu-images setting whether the image will be displayed or not.

image-menu-item
a <gtk-image-menu-item>.
image a widget to set as the image for the menu item.

gtk-image-menu-item-get-image (self <gtk-image-menu-item>)
⇒ (ret <gtk-widget>)
get-image
Gets the widget that is currently set as the image of image-menu-item. See gtk-
image-menu-item-set-image.

image-menu-item
a <gtk-image-menu-item>.
ret the widget set as image of image-menu-item.

gtk-image-menu-item-new ⇒ (ret <gtk-widget>)
Creates a new <gtk-image-menu-item> with an empty label.

ret a new <gtk-image-menu-item>.

gtk-image-menu-item-new-from-stock (stock_id mchars)
 accel_group <gtk-accel-group>) ⇒ (ret <gtk-widget>)
Creates a new <gtk-image-menu-item> containing the image and text from a stock
item. Some stock ids have preprocessor macros like <gtk-stock-ok> and <gtk-
stock-apply>.
If you want this menu item to have changeable accelerators, then pass in ‘#f’ for
accel_group. Next call gtk-menu-item-set-accel-path with an appropriate path
for the menu item, use `gtk-stock-lookup` to look up the standard accelerator for the stock item, and if one is found, call `gtk-accel-map-add-entry` to register it.

- `stock-id` the name of the stock item.
- `accel-group` the `<gtk-accel-group>` to add the menu items accelerator to, or `'#f'`.
- `ret` a new `<gtk-image-menu-item>`.

### gtk-image-menu-item-new-with-label (label mchars)

**Function**

- `label` the text of the menu item.
- `ret` a new `<gtk-image-menu-item>`.

```
gtk-image-menu-item-new-with-label (label mchars) ⇒ (ret <gtk-widget>)
```

Creates a new `<gtk-image-menu-item>` containing a label.
61 GtkRadioMenuItem

A choice from multiple check menu items

61.1 Overview

A radio menu item is a check menu item that belongs to a group. At each instant exactly one of the radio menu items from a group is selected.

The group list does not need to be freed, as each `<gtk-radio-menu-item>` will remove itself and its list item when it is destroyed.

The correct way to create a group of radio menu items is approximatively this:

```c
GSList *group = NULL;
GtkWidget *item;
 gint i;

for (i = 0; i < 5; i++)
{
    item = gtk_radio_menu_item_new_with_label (group, "This is an example");
    group = gtk_radio_menu_item_get_group (GTK_RADIO_MENU_ITEM (item));
    if (i == 1)
        gtk_check_menu_item_set_active (GTK_CHECK_MENU_ITEM (item), TRUE);
}
```

61.2 Usage

`<gtk-radio-menu-item>` [Class]

Derives from `<gtk-check-menu-item>`. This class defines the following slots:

- `group` The radio menu item whose group this widget belongs to.

`group-changed` [Signal on `<gtk-radio-menu-item>`]

`gtk-radio-menu-item-new (group <gtk-radio-group*>)` [Function]

⇒ (ret `<gtk-widget>`) Creates a new `<gtk-radio-menu-item>`.

- `group` the group to which the radio menu item is to be attached
- `ret` a new `<gtk-radio-menu-item>`

`gtk-radio-menu-item-new-with-label (group <gtk-radio-group*>) (label mchars)` [Function]

⇒ (ret `<gtk-widget>`) Creates a new `<gtk-radio-menu-item>` whose child is a simple `<gtk-label>`.

- `group` the group to which the radio menu item is to be attached
- `label` the text for the label
- `ret` a new `<gtk-radio-menu-item>`
Chapter 61: GtkRadioMenuItem

`gtk-radio-menu-item-new-from-widget` [Function]

```
(group <gtk-radio-menu-item>) ⇒ (ret <gtk-widget>)
```

Creates a new `gtk-radio-menu-item` adding it to the same group as `group`.

- `group` An existing `gtk-radio-menu-item`
- `ret` The new `gtk-radio-menu-item`

Since 2.4

`gtk-radio-menu-item-set-group (self <gtk-radio-menu-item>)` [Function]

```
(set-group
  (group <gtk-radio-group*>)
)
```

Sets the group of a radio menu item, or changes it.

- `radio-menu-item` a `gtk-radio-menu-item`.
- `group` the new group.

`gtk-radio-menu-item-get-group (self <gtk-radio-menu-item>)` [Function]

```
(get-group
  ⇒ (ret <gtk-radio-group*>)
)
```

Returns the group to which the radio menu item belongs, as a `g-list` of `gtk-radio-menu-item`. The list belongs to GTK+ and should not be freed.

- `radio-menu-item` a `gtk-radio-menu-item`.
- `ret` the group of `radio-menu-item`.
Chapter 62: GtkCheckMenuItem

62 GtkCheckMenuItem

A menu item with a check box

62.1 Overview

A `<gtk-check-menu-item>` is a menu item that maintains the state of a boolean value in addition to a `<gtk-menu-item>`’s usual role in activating application code.

A check box indicating the state of the boolean value is displayed at the left side of the `<gtk-menu-item>`. Activating the `<gtk-menu-item>` toggles the value.

62.2 Usage

`
<gtk-check-menu-item>
`  
[Class]
Derives from `<gtk-menu-item>`.
This class defines the following slots:

- `active` Whether the menu item is checked
- `inconsistent` Whether to display an "inconsistent" state
- `draw-as-radio` Whether the menu item looks like a radio menu item

`toggled`  
[Signal on `<gtk-check-menu-item>`]
This signal is emitted when the state of the check box is changed.
A signal handler can examine the `<gtk-check-menu-item>` struct to discover the new state.

`gtk-check-menu-item-new`  
[Function]
Creates a new `<gtk-check-menu-item>`.

`ret` a new `<gtk-check-menu-item>`.

`gtk-check-menu-item-new-with-label (label mchars)`  
[Function]
Creates a new `<gtk-check-menu-item>` with a label.

`label` the string to use for the label.

`ret` a new `<gtk-check-menu-item>`.

`gtk-check-menu-item-get-active (self <gtk-check-menu-item>)`  
[Function]
Returns whether the check menu item is active. See `gtk-check-menu-item-set-active`.

`check-menu-item` a `<gtk-check-menu-item>`

`ret` ‘#t’ if the menu item is checked.
gtk-check-menu-item-set-active (self <gtk-check-menu-item>)  [Function]
(is_active bool)

set-active  [Method]
Sets the active state of the menu item’s check box.

check-menu-item
  a <gtk-check-menu-item>.

is-active  boolean value indicating whether the check box is active.

gtk-check-menu-item-toggled (self <gtk-check-menu-item>)  [Function]
toggled  [Method]
Emits the GtkCheckMenuItem::toggled signal.

check-menu-item
  a <gtk-check-menu-item>.
63 GtkSeparatorMenuItem

A separator used in menus

63.1 Overview

The `<gtk-separator-menu-item>` is a separator used to group items within a menu. It displays a horizontal line with a shadow to make it appear sunken into the interface.

63.2 Usage

```
<gtk-separator-menu-item>   [Class]
    Derives from `<gtk-menu-item>`.
    This class defines no direct slots.

gtk-separator-menu-item-new ⇒ (ret <gtk-widget>)   [Function]
    Creates a new `<gtk-separator-menu-item>`.
    ret a new `<gtk-separator-menu-item>`.
```
64 GtkTearoffMenuItem

A menu item used to tear off and reattach its menu

64.1 Overview

A <gtk-tearoff-menu-item> is a special <gtk-menu-item> which is used to tear off and reattach its menu.

When its menu is shown normally, the <gtk-tearoff-menu-item> is drawn as a dotted line indicating that the menu can be torn off. Activating it causes its menu to be torn off and displayed in its own window as a tearoff menu.

When its menu is shown as a tearoff menu, the <gtk-tearoff-menu-item> is drawn as a dotted line which has a left pointing arrow graphic indicating that the tearoff menu can be reattached. Activating it will erase the tearoff menu window.

64.2 Usage

<gtk-tearoff-menu-item> [Class]

Derives from <gtk-menu-item>. This class defines no direct slots.

gtk-tearoff-menu-item-new ⇒ (ret <gtk-widget>) [Function]

Creates a new <gtk-tearoff-menu-item>.

ret a new <gtk-tearoff-menu-item>.
65 GtkToolbar

Create bars of buttons and other widgets

65.1 Overview

A toolbar is created with a call to `gtk-toolbar-new`. A toolbar can contain instances of a subclass of `<gtk-tool-item>`. To add a `<gtk-tool-item>` to the toolbar, use `gtk-toolbar-insert`. To remove an item from the toolbar use `gtk-container-remove`. To add a button to the toolbar, add an instance of `<gtk-tool-button>.

Toolbar items can be visually grouped by adding instances of `<gtk-separator-tool-item>` to the toolbar. If a `<gtk-separator-tool-item>` has the "expand" property set to `#t` and the "draw" property set to `#f` the effect is to force all following items to the end of the toolbar.

Creating a context menu for the toolbar can be done by connecting to the `<gtk-toolbar::popup-context-menu>` signal.

65.2 Usage

`<gtk-toolbar>`

Derives from `<gtk-container>`. This class defines the following slots:

- `orientation`
  The orientation of the toolbar

- `toolbar-style`
  How to draw the toolbar

- `show-arrow`
  If an arrow should be shown if the toolbar doesn’t fit

- `tooltips`
  If the tooltips of the toolbar should be active or not

- `icon-size`
  Size of icons in this toolbar

- `icon-size-set`
  Whether the icon-size property has been set

`orientation-changed (arg0 <gtk-orientation>)`  [Signal on `<gtk-toolbar>`]

Emitted when the orientation of the toolbar changes.

`style-changed (arg0 <gtk-toolbar-style>)`  [Signal on `<gtk-toolbar>`]

Emitted when the style of the toolbar changes.

`popup-context-menu (arg0 <gint>) (arg1 <gint>) (arg2 <gint>) ⇒ <gboolean>`  [Signal on `<gtk-toolbar>`]

Emitted when the user right-clicks the toolbar or uses the keybinding to display a popup menu.
Application developers should handle this signal if they want to display a context menu on the toolbar. The context-menu should appear at the coordinates given by x and y. The mouse button number is given by the button parameter. If the menu was popped up using the keyboard, button is -1.

**focus-home-or-end (arg0 <gboolean>)**  
⇒ <gboolean>  
A keybinding signal used internally by GTK+. This signal can’t be used in application code

**gtk-toolbar-new ⇒ (ret <gtk-widget>)**  
Creates a new toolbar.  
ret the newly-created toolbar.

**gtk-toolbar-insert (self <gtk-toolbar>) (item <gtk-tool-item>) (pos int)**  
Insert a <gtk-tool-item> into the toolbar at position pos. If pos is 0 the item is prepended to the start of the toolbar. If pos is negative, the item is appended to the end of the toolbar.  

Since 2.4

**gtk-toolbar-get-item-index (self <gtk-toolbar>) (item <gtk-tool-item>) ⇒ (ret int)**  
Returns the position of item on the toolbar, starting from 0. It is an error if item is not a child of the toolbar.  

Since 2.4

**gtk-toolbar-get-n-items (self <gtk-toolbar>) ⇒ (ret int)**  
Returns the number of items on the toolbar.
Chapter 65: GtkToolbar

**gtk-toolbar-get-nth-item** *(self <gtk-toolbar>) (n int)*  

⇒ *(ret <gtk-tool-item>)*

**get-nth-item**  
Returns the *n*’th item on toolbar, or ‘#f’ if the toolbar does not contain an *n*’th item.

*toolbar*  
a <gtk-toolbar>

*n*  
A position on the toolbar

*ret*  
The *n*’th <gtk-tool-item> on toolbar, or ‘#f’ if there isn’t an *n*’th item.

Since 2.4

**gtk-toolbar-get-drop-index** *(self <gtk-toolbar>) (x int) (y int)*  

⇒ *(ret int)*

**get-drop-index**  
Returns the position corresponding to the indicated point on toolbar. This is useful when dragging items to the toolbar: this function returns the position a new item should be inserted.

*x* and *y* are in toolbar coordinates.

*toolbar*  
a <gtk-toolbar>

*x*  
x coordinate of a point on the toolbar

*y*  
y coordinate of a point on the toolbar

*ret*  
The position corresponding to the point (*x*, *y*) on the toolbar.

Since 2.4

**gtk-toolbar-set-drop-highlight-item** *(self <gtk-toolbar>) (tool_item <gtk-tool-item>) (index int)*  

**set-drop-highlight-item**  
Highlights toolbar to give an idea of what it would look like if *item* was added to toolbar at the position indicated by *index*. If *item* is ‘#f’, highlighting is turned off. In that case *index* is ignored.

The *tool-item* passed to this function must not be part of any widget hierarchy. When an item is set as drop highlight item it cannot be added to any widget hierarchy or used as highlight item for another toolbar.

*toolbar*  
a <gtk-toolbar>

*tool-item*  
a <gtk-tool-item>, or ‘#f’ to turn off highlighting

*index*  
a position on toolbar

Since 2.4

**gtk-toolbar-set-show-arrow** *(self <gtk-toolbar>) (show_arrow bool)*  

**set-show-arrow**  
Sets whether to show an overflow menu when toolbar doesn’t have room for all items on it. If ‘#t’, items that there are not room are available through an overflow menu.
Chapter 65: GtkToolbar

`toolbar` a `<gtk-toolbar>`

`show-arrow` Whether to show an overflow menu

Since 2.4

`gtk-toolbar-set-orientation (self <gtk-toolbar>)` [Function]

`set-orientation (orientation <gtk-orientation>)` [Method]

Sets whether a toolbar should appear horizontally or vertically.

`toolbar` a `<gtk-toolbar>`.
`orientation` a new `<gtk-orientation>`.

`gtk-toolbar-set-tooltips (self <gtk-toolbar>) (enable bool)` [Function]

`set-tooltips` [Method]

Sets if the tooltips of a toolbar should be active or not.

`toolbar` a `<gtk-toolbar>`.
`enable` set to ‘#f’ to disable the tooltips, or ‘#t’ to enable them.

`gtk-toolbar-get-show-arrow (self <gtk-toolbar>) ⇒ (ret bool)` [Function]

`get-show-arrow` [Method]

Returns whether the toolbar has an overflow menu. See `gtk-toolbar-set-show-arrow`.

`toolbar` a `<gtk-toolbar>`
`ret` ‘#t’ if the toolbar has an overflow menu.

Since 2.4

`gtk-toolbar-get-orientation (self <gtk-toolbar>) ⇒ (ret <gtk-orientation>)` [Function]

`get-orientation` [Method]

Retrieves the current orientation of the toolbar. See `gtk-toolbar-set-orientation`.

`toolbar` a `<gtk-toolbar>`
`ret` the orientation

`gtk-toolbar-get-style (self <gtk-toolbar>) ⇒ (ret <gtk-toolbar-style>)` [Function]

`get-style` [Method]

Retrieves whether the toolbar has text, icons, or both. See `gtk-toolbar-set-style`.

`toolbar` a `<gtk-toolbar>`
`ret` the current style of `toolbar`
**gtk-toolbar-get-icon-size** (self <gtk-toolbar>) ⇒ (ret <gtk-icon-size>)

*get-icon-size*

Retrieves the icon size for the toolbar. See *gtk-toolbar-set-icon-size*.

*toolbar* a <gtk-toolbar>

*ret* the current icon size for the icons on the toolbar.

**gtk-toolbar-get-tooltips** (self <gtk-toolbar>) ⇒ (ret bool)

*get-tooltips*

Retrieves whether tooltips are enabled. See *gtk-toolbar-set-tooltips*.

*toolbar* a <gtk-toolbar>

*ret* ‘#t’ if tooltips are enabled

**gtk-toolbar-get-relief-style** (self <gtk-toolbar>) ⇒ (ret <gtk-relief-style>)

*get-relief-style*

Returns the relief style of buttons on *toolbar*. See *gtk-button-set-relief*.

*toolbar* a <gtk-toolbar>

*ret* The relief style of buttons on *toolbar*.

Since 2.4

**gtk-toolbar-set-style** (self <gtk-toolbar>) (style <gtk-toolbar-style>)

*set-style*

Alters the view of *toolbar* to display either icons only, text only, or both.

*toolbar* a <gtk-toolbar>.

*style* the new style for *toolbar*.

**gtk-toolbar-unset-style** (self <gtk-toolbar>)

*unset-style*

Unsets a toolbar style set with *gtk-toolbar-set-style*, so that user preferences will be used to determine the toolbar style.

*toolbar* a <gtk-toolbar>
66 GtkToolItem

The base class of widgets that can be added to GtkToolbar

66.1 Overview

GtkToolItem widgets are widgets that can appear on a toolbar. To create a toolbar item that contain something else than a button, use `gtk-tool-item-new`. Use `gtk-container-add` to add a child widget to the tool item.

For toolbar items that contain buttons, see the `<gtk-tool-button>`, `<gtk-toggle-tool-button>` and `<gtk-radio-tool-button>` classes.

66.2 Usage

```sql
<gtk-tool-item>
  Derives from `<gtk-bin>`.
  This class defines the following slots:
    visible-horizontal
      Whether the toolbar item is visible when the toolbar is in a horizontal orientation.
    visible-vertical
      Whether the toolbar item is visible when the toolbar is in a vertical orientation.
    is-important
      Whether the toolbar item is considered important. When TRUE, toolbar buttons show text in GTK TOOLBAR BOTH HORIZ mode

create-menu-proxy ⇒ <gboolean> [Signal on `<gtk-tool-item>`]
  This signal is emitted when the toolbar needs information from tool-item about whether the item should appear in the toolbar overflow menu. In response the tool item should either
  • call `gtk-tool-item-set-proxy-menu-item` with a ‘#f’ pointer and return ‘#t’ to indicate that the item should not appear in the overflow menu
  • call `gtk-tool-item-set-proxy-menu-item` with a new menu item and return ‘#t’, or
  • return ‘#f’ to indicate that the signal was not handled by the item. This means that the item will not appear in the overflow menu unless a later handler installs a menu item.

  The toolbar may cache the result of this signal. When the tool item changes how it will respond to this signal it must call `gtk-tool-item-rebuild-menu` to invalidate the cache and ensure that the toolbar rebuilds its overflow menu.

toolbar-reconfigured [Signal on `<gtk-tool-item>`]
  This signal is emitted when some property of the toolbar that the item is a child of changes. For custom subclasses of `<gtk-tool-item>`, the default handler of this
signal use the functions to find out what the toolbar should look like and change themselves accordingly:

- gtk-toolbar-get-orientation
- gtk-toolbar-get-style
- gtk-toolbar-get-icon-size
- gtk-toolbar-get-relief-style

set-tooltip (arg0 <gtk-tooltips>) [Signal on <gtk-tool-item>]
(arg1 <gchararray>) (arg2 <gchararray>) ⇒ <gboolean>
This signal is emitted when the toolitem’s tooltip changes. Application developers can use gtk-tool-item-set-tooltip to set the item’s tooltip.

gtk-tool-item-new ⇒ (ret <gtk-tool-item>) [Function]
Creates a new <gtk-tool-item>
ret the new <gtk-tool-item>
Since 2.4

gtk-tool-item-set-homogeneous (self <gtk-tool-item>) [Function]
(homogeneous bool)
set-homogeneous [Method]
Sets whether tool-item is to be allocated the same size as other homogeneous items. The effect is that all homogeneous items will have the same width as the widest of the items.

tool-item a <gtk-tool-item:>

homogeneous whether tool-item is the same size as other homogeneous items
Since 2.4

gtk-tool-item-get-homogeneous (self <gtk-tool-item>) [Function]
⇒ (ret bool)
get-homogeneous [Method]
Returns whether tool-item is the same size as other homogeneous items. See gtk-tool-item-set-homogeneous.

tool-item a <gtk-tool-item:>

ret ‘#t’ if the item is the same size as other homogeneous item.s
Since 2.4

gtk-tool-item-set-expand (self <gtk-tool-item>) (expand bool) [Function]
set-expand [Method]
Sets whether tool-item is allocated extra space when there is more room on the toolbar then needed for the items. The effect is that the item gets bigger when the toolbar gets bigger and smaller when the toolbar gets smaller.

tool-item a <gtk-tool-item:>
expand Whether tool-item is allocated extra space
Since 2.4
Chapter 66: GtkToolItem

**gtk-tool-item-get-expand** *(self <gtk-tool-item>)* \⇒ (ret bool)  
*Function*

get-expand  
*Method*

Returns whether *tool-item* is allocated extra space. See *gtk-tool-item-set-expand*.

*tool-item*  a <gtk-tool-item:>

*ret*  ‘#t’ if *tool-item* is allocated extra space.

Since 2.4

**gtk-tool-item-set-tooltip** *(self <gtk-tool-item>)*  
*(tooltips <gtk-tooltips>)(tip-text mchars)(tip-private mchars)*  
*Function*

**set-tooltip**  
*Method*

Sets the <gtk-tooltips> object to be used for *tool-item*, the text to be displayed as tooltip on the item and the private text to be used. See *gtk-tooltips-set-tip*.

*tool-item*  a <gtk-tool-item:>

*tooltips*  The <gtk-tooltips> object to be used

*tip-text*  text to be used as tooltip text for *tool-item*

*tip-private*  text to be used as private tooltip text

Since 2.4

**gtk-tool-item-set-use-drag-window** *(self <gtk-tool-item>)*  
*(use-drag-window bool)*  
*Function*

**set-use-drag-window**  
*Method*

Sets whether *toolitem* has a drag window. When ‘#t’ the *toolitem* can be used as a drag source through *gtk-drag-source-set*. When *toolitem* has a drag window it will intercept all events, even those that would otherwise be sent to a child of *toolitem*.

*toolitem*  a <gtk-tool-item:>

*use-drag-window*  Whether *toolitem* has a drag window.

Since 2.4

**gtk-tool-item-get-use-drag-window** *(self <gtk-tool-item>)*  
\⇒ (ret bool)  
*Function*

**get-use-drag-window**  
*Method*

Returns whether *toolitem* has a drag window. See *gtk-tool-item-set-use-drag-window*.

*toolitem*  a <gtk-tool-item:>

*ret*  ‘#t’ if *toolitem* uses a drag window.

Since 2.4
gtk-tool-item-set-visible-vertical (self <gtk-tool-item>)  [Function]
(  (visible_vertical  bool)
set-visible-vertical  [Method]
Sets whether toolitem is visible when the toolbar is docked vertically. Some tool
items, such as text entries, are too wide to be useful on a vertically docked toolbar. If
visible-vertical is '#f' toolitem will not appear on toolbars that are docked vertically.

    toolitem  a <gtk-tool-item>
    visible-vertical
      whether toolitem is visible when the toolbar is in vertical mode

Since 2.4

gtk-tool-item-get-visible-vertical (self <gtk-tool-item>)  [Function]
     (  (ret  bool)
get-visible-vertical  [Method]
Returns whether toolitem is visible when the toolbar is docked vertically. See gtk-
    tool-item-set-visible-vertical.

    toolitem  a <gtk-tool-item>
    ret
      Whether toolitem is visible when the toolbar is docked vertically

Since 2.4

gtk-tool-item-set-is-important (self <gtk-tool-item>)  [Function]
(  (is_important  bool)
set-is-important  [Method]
Sets whether tool-item should be considered important. The <gtk-tool-button>
class uses this property to determine whether to show or hide its label when the
toolbar style is 'GTK_TOOLBAR_BOTH_HORIZ'. The result is that only tool buttons with
the 'is_important' property set have labels, an effect known as "priority text"

    tool-item  a <gtk-tool-item>
    is-important
      whether the tool item should be considered important

Since 2.4

gtk-tool-item-get-is-important (self <gtk-tool-item>)  [Function]
     (  (ret  bool)
get-is-important  [Method]
Returns whether tool-item is considered important. See gtk-tool-item-set-is-
    important

    tool-item  a <gtk-tool-item>
    ret
      't' if tool-item is considered important.

Since 2.4
Chapter 66: GtkToolItem

```c
gtk-tool-item-get-icon-size (self <gtk-tool-item>) ⇒ (ret <gtk-icon-size>)
get-icon-size

Returns the icon size used for tool-item. Custom subclasses of <gtk-tool-item> should call this function to find out what size icons they should use.

  tool-item a <gtk-tool-item:>
  ret a <gtk-icon-size> indicating the icon size used for tool-item

Since 2.4
```

```c
gtk-tool-item-get-orientation (self <gtk-tool-item>) ⇒ (ret <gtk-orientation>)
get-orientation

Returns the orientation used for tool-item. Custom subclasses of <gtk-tool-item> should call this function to find out what size icons they should use.

  tool-item a <gtk-tool-item:>
  ret a <gtk-orientation> indicating the orientation used for tool-item

Since 2.4
```

```c
gtk-tool-item-get-toolbar-style (self <gtk-tool-item>) ⇒ (ret <gtk-toolbar-style>)
get-toolbar-style

Returns the toolbar style used for tool-item. Custom subclasses of <gtk-tool-item> should call this function in the handler of the GtkToolItem::toolbar_reconfigured signal to find out in what style the toolbar is displayed and change themselves accordingly.

Possibilities are:

- GTK_TOOLBAR_BOTH, meaning the tool item should show both an icon and a label, stacked vertically
- GTK_TOOLBAR_ICONS, meaning the toolbar shows only icons
- GTK_TOOLBAR_TEXT, meaning the tool item should only show text
- GTK_TOOLBAR_BOTH_HORIZ, meaning the tool item should show both an icon and a label, arranged horizontally (however, note the <gtk-tool-button::has-text-horizontally> that makes tool buttons not show labels when the toolbar style is GTK_TOOLBAR_BOTH_HORIZ.

  tool-item a <gtk-tool-item:>
  ret A <gtk-toolbar-style> indicating the toolbar style used for tool-item.

Since 2.4
```

```c
gtk-tool-item-get-relief-style (self <gtk-tool-item>) ⇒ (ret <gtk-relief-style>)
get-relief-style

Returns the relief style of tool-item. See gtk-button-set-relief-style. Custom subclasses of <gtk-tool-item> should call this function in the handler of the <gtk-tool-item::toolbar-reconfigured> signal to find out the relief style of buttons.
```
tool-item a <gtk-tool-item:>
ret a <gtk-relief-style> indicating the relief style used for tool-item.

Since 2.4

gtk-tool-item-get-proxy-menu-item (self <gtk-tool-item>) [Function]
(menu_item_id mchars) ⇒ (ret <gtk-widget>)
get-proxy-menu-item [Method]
If menu-item-id matches the string passed to gtk-tool-item-set-proxy-menu-item return the corresponding <gtk-menu-item>. Custom subclasses of <gtk-tool-item> should use this function to update their menu item when the <gtk-tool-item> changes. That the menu-item-ids must match ensures that a <gtk-tool-item> will not inadvertently change a menu item that they did not create.

tool-item a <gtk-tool-item:>
menu-item-id a string used to identify the menu item
ret The <gtk-menu-item> passed to gtk-tool-item-set-proxy-menu-item, if the menu-item-ids match.

Since 2.4

gtk-tool-item-set-proxy-menu-item (self <gtk-tool-item>) [Function]
(menu_item_id mchars) (menu_item <gtk-widget>)
set-proxy-menu-item [Method]
Sets the <gtk-menu-item> used in the toolbar overflow menu. The menu-item-id is used to identify the caller of this function and should also be used with gtk-tool-item-get-proxy-menu-item.

tool-item a <gtk-tool-item:>
menu-item-id a string used to identify menu-item

Since 2.4

gtk-tool-item-rebuild-menu (self <gtk-tool-item>) [Function]
rebuild-menu [Method]
Calling this function signals to the toolbar that the overflow menu item for tool-item has changed. If the overflow menu is visible when this function it called, the menu will be rebuilt.
The function must be called when the tool item changes what it will do in response to the "create_menu_proxy" signal.

tool-item a <gtk-tool-item>
67 GtkSeparatorToolItem

A toolbar item that separates groups of other toolbar items

67.1 Overview

A <gtk-separator-item> is a <gtk-tool-item> that separates groups of other <gtk-tool-items>. Depending on the theme, a <gtk-separator-tool-item> will often look like a vertical line on horizontally docked toolbars.

If the property "expand" is #t and the property "draw" is #f, a <gtk-separator-tool-item> will act as a "spring" that forces other items to the ends of the toolbar.

Use gtk-separator-tool-item-new to create a new <gtk-separator-tool-item>.

67.2 Usage

<gtk-separator-tool-item> [Class]
Derives from <gtk-tool-item>.
This class defines the following slots:
  draw Whether the separator is drawn, or just blank

gtk-separator-tool-item-new ⇒ (ret <gtk-tool-item>) [Function]
Create a new <gtk-separator-tool-item>
ret the new <gtk-separator-tool-item>
Since 2.4

gtk-separator-tool-item-set-draw [Function]
(self <gtk-separator-tool-item>) (draw bool)
set-draw [Method]
When separator-tool-items is drawn as a vertical line, or just blank. Setting this #f along with gtk-tool-item-set-expand is useful to create an item that forces following items to the end of the toolbar.
  item a <gtk-separator-tool-item>
  draw whether separator-tool-item is drawn as a vertical line
Since 2.4

gtk-separator-tool-item-get-draw [Function]
(self <gtk-separator-tool-item>) ⇒ (ret bool)
get-draw [Method]
Returns whether separator-tool-item is drawn as a line, or just blank. See gtk-separator-tool-item-set-draw.
  item a <gtk-separator-tool-item>
  ret #t if separator-tool-item is drawn as a line, or just blank.
Since 2.4
Chapter 68: GtkToolButton

A GtkToolItem subclass that displays buttons

68.1 Overview

<gtk-tool-button>s are <gtk-tool-items> containing buttons.

Use gtk-tool-button-new to create a new <gtk-tool-button>. Use gtk-tool-button-new-with-stock to create a <gtk-tool-button> containing a stock item.

The label of a <gtk-tool-button> is determined by the properties "label_widget", "label", and "stock_id". If "label_widget" is non-'#f', then that widget is used as the label. Otherwise, if "label" is non-'#f', that string is used as the label. Otherwise, if "stock_id" is non-'#f', the label is determined by the stock item. Otherwise, the button does not have a label.

The icon of a <gtk-tool-button> is determined by the properties "icon_widget" and "stock_id". If "icon_widget" is non-'#f', then that widget is used as the icon. Otherwise, if "stock_id" is non-'#f', the icon is determined by the stock item. Otherwise, the button does not have a label.

68.2 Usage

<gtk-tool-button> [Class]

Derives from <gtk-tool-item>.

This class defines the following slots:

label Text to show in the item.

use-underline If set, an underline in the label property indicates that the next character should be used for the mnemonic accelerator key in the overflow menu

label-widget Widget to use as the item label

stock-id The stock icon displayed on the item

icon-name The name of the themed icon displayed on the item

icon-widget Icon widget to display in the item

clicked [Signal on <gtk-tool-button>]

This signal is emitted when the tool button is clicked with the mouse or activated with the keyboard.

gtk-tool-button-new (icon_widget <gtk-widget>) (label mchars) [Function]

⇒ (ret <gtk-tool-item>)

Creates a new 'GtkToolButton' using icon_widget as icon and label as label.
icon-widget
   a widget that will be used as icon widget, or ‘#f’
label
   a string that will be used as label, or ‘#f’
ret
   A new <gtk-tool-button>

Since 2.4

gtk-tool-button-new-from-stock (stock_id mchars) [Function]
⇒ (ret <gtk-tool-item>)
Creates a new <gtk-tool-button> containing the image and text from a stock item. Some stock ids have preprocessor macros like <gtk-stock-ok> and <gtk-stock-apply>. It is an error if stock-id is not a name of a stock item.
stock-id   the name of the stock item
ret         A new <gtk-tool-button>

Since 2.4

gtk-tool-button-set-label (self <gtk-tool-button>) [Function]
(label mchars)
set-label [Method]
Sets label as the label used for the tool button. The "label" property only has an effect if not overridden by a non-’#f’ "label_widget" property. If both the "label_widget" and "label" properties are ‘#f’, the label is determined by the "stock_id" property. If the "stock_id" property is also ‘#f’, button will not have a label.
button     a <gtk-tool-button>
label      a string that will be used as label, or ‘#f’.

Since 2.4

gtk-tool-button-get-label (self <gtk-tool-button>) [Function]
⇒ (ret mchars)
get-label [Method]
Returns the label used by the tool button, or ‘#f’ if the tool button doesn’t have a label. or uses a the label from a stock item. The returned string is owned by GTK+, and must not be modified or freed.
button     a <gtk-tool-button>
ret         The label, or ‘#f’

Since 2.4

gtk-tool-button-set-use-underline (self <gtk-tool-button>) [Function]
(use_underline bool)
set-use-underline [Method]
If set, an underline in the label property indicates that the next character should be used for the mnemonic accelerator key in the overflow menu. For example, if the label
property is "_Open" and \textit{use-underline} is \char\#t, the label on the tool button will be "Open" and the item on the overflow menu will have an underlined 'O'.

Labels shown on tool buttons never have mnemonics on them; this property only affects the menu item on the overflow menu.

\begin{verbatim}
button a <gtk-tool-button>
use-underline
whether the button label has the form "_Open"
\end{verbatim}

Since 2.4

\begin{verbatim}
gtk-tool-button-get-use-underline (self <gtk-tool-button>) [Function]
⇒ (ret bool)
get-use-underline [Method]
Returns whether underscores in the label property are used as mnemonics on menu items on the overflow menu. See gtk-tool-button-set-use-underline.
button a <gtk-tool-button>
ret \char\#t' if underscores in the label property are used as mnemonics on menu items on the overflow menu.
\end{verbatim}

Since 2.4

\begin{verbatim}
gtk-tool-button-set-stock-id (self <gtk-tool-button>) [Function]
(stock_id mchars)
set-stock-id [Method]
Sets the name of the stock item. See gtk-tool-button-new-from-stock. The stock_id property only has an effect if not overridden by non-\char\#f "label" and "icon_widget" properties.
button a <gtk-tool-button>
stock-id a name of a stock item, or \char\#f
\end{verbatim}

Since 2.4

\begin{verbatim}
gtk-tool-button-get-stock-id (self <gtk-tool-button>) [Function]
⇒ (ret mchars)
get-stock-id [Method]
Returns the name of the stock item. See gtk-tool-button-set-stock-id. The returned string is owned by GTK+ and must not be freed or modified.
button a <gtk-tool-button>
ret the name of the stock item for button.
\end{verbatim}

Since 2.4

\begin{verbatim}
gtk-tool-button-set-icon-name (self <gtk-tool-button>) [Function]
(icon_name mchars)
set-icon-name [Method]
Sets the icon for the tool button from a named themed icon. See the docs for \texttt{<gtk-icon-theme>} for more details. The "icon_name" property only has an effect if not overridden by non-\char\#f "label", "icon_widget" and "stock_id" properties.
\end{verbatim}
button  a <gtk-tool-button>

icon-name  the name of the themed icon

Since 2.8

gtk-tool-button-get-icon-name (self <gtk-tool-button>)  [Function]
⇒ (ret mchars)

get-icon-name  [Method]
Returns the name of the themed icon for the tool button, see gtk-tool-button-set-icon-name.

button  a <gtk-tool-button>
ret  the icon name or ‘#f’ if the tool button has no themed icon

Since 2.8

gtk-tool-button-set-icon-widget (self <gtk-tool-button>)  [Function]
(ico_widget <gtk-widget>)

set-icon-widget  [Method]
Sets ico as the widget used as icon on button. If ico-widget is ‘#f’ the icon is determined by the "stock_id" property. If the "stock_id" property is also ‘#f’, button will not have an icon.

button  a <gtk-tool-button>
ico-widget  the widget used as icon, or ‘#f’

Since 2.4

gtk-tool-button-get-icon-widget (self <gtk-tool-button>)  [Function]
⇒ (ret <gtk-widget>)

get-icon-widget  [Method]
Return the widget used as icon widget on button. See gtk-tool-button-set-icon-widget.

button  a <gtk-tool-button>
ret  The widget used as icon on button, or ‘#f’.

Since 2.4

gtk-tool-button-set-label-widget (self <gtk-tool-button>)  [Function]
(label-widget <gtk-widget>)

set-label-widget  [Method]
Sets label-widget as the widget that will be used as the label for button. If label-widget is ‘#f’ the "label" property is used as label. If "label" is also ‘#f’, the label in the stock item determined by the "stock_id" property is used as label. If "stock_id" is also ‘#f’, button does not have a label.

button  a <gtk-tool-button>
label-widget  the widget used as label, or ‘#f’

Since 2.4
**gtk-tool-button-get-label-widget** *(self <gtk-tool-button>)*

⇒ (ret <gtk-widget>)

**get-label-widget**

Returns the widget used as label on *button*. See *gtk-tool-button-set-label-widget*.

*button*  a <gtk-tool-button>

*ret*  The widget used as label on *button*, or ‘#f’.

Since 2.4
69 GtkMenuToolButton

A GtkToolItem containing a button with an additional dropdown menu

69.1 Overview

A <gtk-menu-tool-button> is a <gtk-tool-item> that contains a button and a small additional button with an arrow. When clicked, the arrow button pops up a dropdown menu.

Use `gtk-menu-tool-button-new` to create a new <gtk-menu-tool-button>. Use `gtk-menu-tool-button-new-from-stock` to create a new <gtk-menu-tool-button> containing a stock item.

69.2 Usage

<gtk-menu-tool-button> [Class]

Derives from <gtk-tool-button>. This class defines the following slots:

menu The dropdown menu

show-menu [Signal on <gtk-menu-tool-button>]

gtk-menu-tool-button-new (icon_widget <gtk-widget>) (label mchars) ⇒ (ret <gtk-tool-item>) [Function]

Creates a new <gtk-menu-tool-button> using `icon-widget` as icon and `label` as label.

icon-widget a widget that will be used as icon widget, or ‘#f’

label a string that will be used as label, or ‘#f’

ret the new <gtk-menu-tool-button>

Since 2.6

gtk-menu-tool-button-new-from-stock (stock_id mchars) ⇒ (ret <gtk-tool-item>) [Function]

Creates a new <gtk-menu-tool-button>. The new <gtk-menu-tool-button> will contain an icon and label from the stock item indicated by `stock-id`.

stock-id the name of a stock item

ret the new <gtk-menu-tool-button>

Since 2.6

gtk-menu-tool-button-set-menu (self <gtk-menu-tool-button>) (menu <gtk-widget>) [Function]

set-menu [Method]

Sets the <gtk-menu> that is popped up when the user clicks on the arrow. If `menu` is NULL, the arrow button becomes insensitive.
Chapter 69: GtkMenuToolButton

button  a <gtk-menu-tool-button>
menu    the <gtk-menu> associated with <gtk-menu-tool-button>

Since 2.6

gtk-menu-tool-button-get-menu (self <gtk-menu-tool-button>)  [Function]
⇒ (ret <gtk-widget>)

get-menu  [Method]
  Gets the <gtk-menu> associated with <gtk-menu-tool-button>.

button  a <gtk-menu-tool-button>
ret      the <gtk-menu> associated with <gtk-menu-tool-button>

Since 2.6
Chapter 70: GtkToggleToolButton

70 GtkToggleToolButton

A GtkToolItem containing a toggle button

70.1 Overview

A <gtk-toggle-tool-button> is a <gtk-tool-item> that contains a toggle button.

Use gtk-toggle-tool-button-new to create a new <gtk-toggle-tool-button>. Use
gtk-toggle-tool-button-new-from-stock to create a new <gtk-toggle-tool-button>
containing a stock item.

70.2 Usage

<gtk-toggle-tool-button> [Class]

Derives from <gtk-tool-button>.

This class defines the following slots:

active If the toggle button should be pressed in or not

toggled [Signal on <gtk-toggle-tool-button>]

Emitted whenever the toggle tool button changes state.

gtk-toggle-tool-button-new ⇒ (ret <gtk-tool-item>) [Function]

Returns a new <gtk-toggle-tool-button>

ret a newly created <gtk-toggle-tool-button>

Since 2.4

gtk-toggle-tool-button-set-active

(self <gtk-toggle-tool-button>)(is_active bool) [Method]

Sets the status of the toggle tool button. Set to ‘#t’ if you want the GtkToggleButton
to be 'pressed in', and ‘#f’ to raise it. This action causes the toggled signal to be
emitted.

button a <gtk-toggle-tool-button>

is-active whether button should be active

Since 2.4

gtk-toggle-tool-button-get-active

(self <gtk-toggle-tool-button>) ⇒ (ret bool) [Function]

Queries a <gtk-toggle-tool-button> and returns its current state. Returns ‘#t’ if
the toggle button is pressed in and ‘#f’ if it is raised.

button a <gtk-toggle-tool-button>

ret ‘#t’ if the toggle tool button is pressed in, ‘#f’ if not

Since 2.4
71 GtkRadioToolButton

A toolbar item that contains a radio button

71.1 Overview

A `<gtk-radio-tool-button>` is a `<gtk-tool-item>` that contains a radio button, that is, a button that is part of a group of toggle buttons where only one button can be active at a time.

Use `gtk-radio-tool-button-new` to create a new `<gtk-radio-tool-button>`. Use `gtk-radio-tool-button-new-from-widget` to create a new `<gtk-radio-tool-button>` that is part of the same group as an existing `<gtk-radio-tool-button>`. Use `gtk-radio-tool-button-new-from-stock` or `gtk-radio-tool-button-new-from-widget-with-stock` to create a new `<gtk-radio-tool-button>` containing a stock item.

71.2 Usage

```xml
tool-bar-item
    [Class]
    Derives from `<gtk-toggle-tool-button>`.
    This class defines the following slots:
    group The radio tool button whose group this button belongs to.

gtk-radio-tool-button-new (group <gtk-radio-group*>) [Function]
    (ret <gtk-tool-item>)
    Creates a new `<gtk-radio-tool-button>`, adding it to `group`.
    group An existing radio button group, or `#f` if you are creating a new group
    ret The new `<gtk-radio-tool-button>`

    Since 2.4

gtk-radio-tool-button-get-group [Function]
    (self <gtk-radio-tool-button>) ⇒ (ret <gtk-radio-group*>)
    get-group [Method]
    Returns the radio button group `button` belongs to.
    button a `<gtk-radio-tool-button>`
    ret The group `button` belongs to.

    Since 2.4

gtk-radio-tool-button-set-group [Function]
    (self <gtk-radio-tool-button>) (group <gtk-radio-group*>)
    set-group [Method]
    Adds `button` to `group`, removing it from the group it belonged to before.
    button a `<gtk-radio-tool-button>`
    group an existing radio button group

    Since 2.4
```
72 GtkUIManager

Constructing menus and toolbars from an XML description

72.1 Overview

A \texttt{<gtk-ui-manager>} constructs a user interface (menus and toolbars) from one or more UI definitions, which reference actions from one or more action groups.

72.2 UI Definitions

The UI definitions are specified in an XML format which can be roughly described by the following DTD. There are some additional restrictions beyond those specified in the DTD, e.g. every toolitem must have a toolbar in its ancestry and every menuitem must have a menubar or popup in its ancestry. Since a \texttt{<g-markup>} parser is used to parse the UI description, it must not only be valid XML, but valid \texttt{<g-markup>}.

```
<!ELEMENT ui  (menubar|toolbar|popup|accelerator)* >
<!ELEMENT menubar (menuitem|separator|placeholder|menu)* >
<!ELEMENT menu  (menuitem|separator|placeholder|menu)* >
<!ELEMENT popup (menuitem|separator|placeholder|menu)* >
<!ELEMENT toolbar (toolitem|separator|placeholder)* >
<!ELEMENT placeholder (menuitem|toolitem|separator|placeholder|menu)* >
<!ELEMENT menuitem EMPTY >
<!ELEMENT toolitem (menu?) >
<!ELEMENT separator EMPTY >
<!ELEMENT accelerator EMPTY >
<!ATTLIST menubar name &#x0023;IMPLIED action #IMPLIED >
<!ATTLIST toolbar name &#x0023;IMPLIED action #IMPLIED >
<!ATTLIST popup name &#x0023;IMPLIED action #IMPLIED >
<!ATTLIST placeholder name &#x0023;IMPLIED action #IMPLIED >
<!ATTLIST separator name &#x0023;IMPLIED action #IMPLIED expand (true|false) #IMPLIED >
<!ATTLIST menu name &#x0023;IMPLIED action #x0023;REQUIRED position (top|bot) #x0023;IMPLIED >
<!ATTLIST menuitem name &#x0023;IMPLIED action #x0023;REQUIRED position (top|bot) #x0023;IMPLIED >
<!ATTLIST toolitem name &#x0023;IMPLIED action #x0023;REQUIRED position (top|bot) #x0023;IMPLIED >
```
<!ATTLIST accelerator name '&#x0023;'IMPLIED
action '&#x0023;'REQUIRED >

If a name is not specified, it defaults to the action. If an action is not specified either, the
element name is used. The name and action attributes must not contain '/' characters
after parsing (since that would mess up path lookup) and must be usable as XML attributes
when enclosed in doublequotes, thus they must not '"' characters or references to the &quot;
entity.

<ui>
  <menubar>
    <menu name="FileMenu" action="FileMenuAction">
      <menuitem name="New" action="New2Action"/>
      <placeholder name="FileMenuAdditions"/>
    </menu>
    <menu name="JustifyMenu" action="JustifyMenuAction">
      <menuitem name="Left" action="justify-left"/>
      <menuitem name="Centre" action="justify-center"/>
      <menuitem name="Right" action="justify-right"/>
      <menuitem name="Fill" action="justify-fill"/>
    </menu>
  </menubar>
  <toolbar action="toolbar1">
    <placeholder name="JustifyToolItems">
      <separator/>
      <toolitem name="Left" action="justify-left"/>
      <toolitem name="Centre" action="justify-center"/>
      <toolitem name="Right" action="justify-right"/>
      <toolitem name="Fill" action="justify-fill"/>
      <separator/>
    </placeholder>
  </toolbar>
</ui>

The constructed widget hierarchy is very similar to the element tree of the XML, with
the exception that placeholders are merged into their parents. The correspondence of XML
elements to widgets should be almost obvious:

toolbar
popup
menu
menuitem
toolitem
separator
accelerator
  a <gtk-menu-bar>
a `<gtk-toolbar>`
a toplevel `<gtk-menu>`
a `<gtk-menu>` attached to a menuitem
a `<gtk-menu>` subclass, the exact type depends on the action
a `<gtk-tool-item>` subclass, the exact type depends on the action. Note that toolitem elements may contain a menu element, but only if their associated action specifies a `<gtk-menu-tool-button>` as proxy.
a `<gtk-separator-menu-item>` or `<gtk-separator-tool-item>`
a keyboard accelerator

The "position" attribute determines where a constructed widget is positioned wrt. to its siblings in the partially constructed tree. If it is "top", the widget is prepended, otherwise it is appended.

72.3 UI Merging

The most remarkable feature of `<gtk-ui-manager>` is that it can overlay a set of menuitems and toolitems over another one, and demerge them later.

Merging is done based on the names of the XML elements. Each element is identified by a path which consists of the names of its ancestors, separated by slashes. For example, the menuitem named "Left" in the example above has the path '/ui/menubar/JustifyMenu/Left' and the toolitem with the same name has path '/ui/toolbar1/JustifyToolItems/Left'.

72.4 Accelerators

Every action has an accelerator path. Accelerators are installed together with menuitem proxies, but they can also be explicitly added with `<accelerator>` elements in the UI definition. This makes it possible to have accelerators for actions even if they have no visible proxies.

72.5 Smart Separators

The separators created by `<gtk-ui-manager>` are "smart", i.e. they do not show up in the UI unless they end up between two visible menu or tool items. Separators which are located at the very beginning or end of the menu or toolbar containing them, or multiple separators next to each other, are hidden. This is a useful feature, since the merging of UI elements from multiple sources can make it hard or impossible to determine in advance whether a separator will end up in such an unfortunate position.

For separators in toolbars, you can set `expand="true"` to turn them from a small, visible separator to an expanding, invisible one. Toolitems following an expanding separator are effectively right-aligned.

72.6 Empty Menus

Submenus pose similar problems to separators in connection with merging. It is impossible to know in advance whether they will end up empty after merging. `<gtk-ui-manager>` offers
two ways to treat empty submenus: The behaviour is chosen based on the "hide_if_empty" property of the action to which the submenu is associated.

- make them disappear by hiding the menu item they’re attached to
- add an insensitive "Empty" item

72.7 Usage

<gtk-ui-manager> [Class]

Derives from <gtk-buildable>, <object>.

This class defines the following slots:

- add-tearoffs: Whether tearoff menu items should be added to menus
- ui: An XML string describing the merged UI

connect-proxy (arg0 <gtk-action>) [Signal on <gtk-ui-manager>]

(arg1 <gtk-widget>)

The connect-proxy signal is emitted after connecting a proxy to an action in the group.

This is intended for simple customizations for which a custom action class would be too clumsy, e.g. showing tooltips for menuitems in the statusbar.

Since 2.4

disconnect-proxy (arg0 <gtk-action>) [Signal on <gtk-ui-manager>]

(arg1 <gtk-widget>)

The disconnect-proxy signal is emitted after disconnecting a proxy from an action in the group.

Since 2.4

pre-activate (arg0 <gtk-action>) [Signal on <gtk-ui-manager>]

The pre-activate signal is emitted just before the action is activated.

This is intended for applications to get notification just before any action is activated.

Since 2.4

post-activate (arg0 <gtk-action>) [Signal on <gtk-ui-manager>]

The post-activate signal is emitted just after the action is activated.

This is intended for applications to get notification just after any action is activated.

Since 2.4

add-widget (arg0 <gtk-widget>) [Signal on <gtk-ui-manager>]

The add-widget signal is emitted for each generated menubar and toolbar. It is not emitted for generated popup menus, which can be obtained by gtk-ui-manager-get-widget.

Since 2.4
actions-changed

The "actions-changed" signal is emitted whenever the set of actions changes.

Since 2.4

gtk-ui-manager-new ⇒ (ret <gtk-ui-manager>)

Creates a new ui manager object.

ret a new ui manager object.

Since 2.4

gtk-ui-manager-set-add-tearoffs (self <gtk-ui-manager>)

( add-tearoffs bool)

set-add-tearoffs

Sets the "add_tearoffs" property, which controls whether menus generated by this
<gtk-ui-manager> will have tearoff menu items.

Note that this only affects regular menus. Generated popup menus never have tearoff
menu items.

self a <gtk-ui-manager>

add-tearoffs whether tearoff menu items are added

Since 2.4

gtk-ui-manager-get-add-tearoffs (self <gtk-ui-manager>)

⇒ ( ret bool)

get-add-tearoffs

Returns whether menus generated by this <gtk-ui-manager> will have tearoff menu
items.

self a <gtk-ui-manager>

ret whether tearoff menu items are added

Since 2.4

gtk-ui-manager-insert-action-group (self <gtk-ui-manager>)

(action_group <gtk-action-group>) (pos int)

insert-action-group

Inserts an action group into the list of action groups associated with self. Actions in
earlier groups hide actions with the same name in later groups.

self a <gtk-ui-manager> object

action-group the action group to be inserted

pos the position at which the group will be inserted.

Since 2.4
```plaintext
Function

gtk-ui-manager-remove-action-group (self <gtk-ui-manager>)  
  (action_group <gtk-action-group>)
remove-action-group
  Removes an action group from the list of action groups associated with self.
  
  self     a <gtk-ui-manager> object
  action-group
   the action group to be removed
  
Since 2.4

Function

gtk-ui-manager-get-action-groups (self <gtk-ui-manager>)
  => (ret glist-of)
get-action-groups
  Returns the list of action groups associated with self.
  
  self     a <gtk-ui-manager> object
  ret      a <g-list> of action groups. The list is owned by GTK+ and should not
           be modified.
  
Since 2.4

Function

gtk-ui-manager-get-accel-group (self <gtk-ui-manager>)
  => (ret <gtk-accel-group>)
get-accel-group
  Returns the <gtk-accel-group> associated with self.
  
  self     a <gtk-ui-manager> object
  ret      the <gtk-accel-group>.
  
Since 2.4

Function

gtk-ui-manager-get-widget (self <gtk-ui-manager>) (path mchars)
  => (ret <gtk-widget>)
get-widget
  Looks up a widget by following a path. The path consists of the names specified
  in the XML description of the UI, separated by '/'. Elements which don't have a
  name or action attribute in the XML (e.g. <popup>) can be addressed by their XML
  element name (e.g. "popup"). The root element ("/ui") can be omitted in the path.
  Note that the widget found by following a path that ends in a <menu> element is the
  menuitem to which the menu is attached, not the menu itself.
  Also note that the widgets constructed by a ui manager are not tied to the lifecycle
  of the ui manager. If you add the widgets returned by this function to some container
  or explicitly ref them, they will survive the destruction of the ui manager.
  
  self     a <gtk-ui-manager>
  path     a path
  ret      the widget found by following the path, or '#f' if no widget was found.
  
Since 2.4
```
**gtk-ui-manager-get-toplevels** *(self <gtk-ui-manager>)*  
*(types <gtk-ui-manager-item-type>)* ⇒ *(ret gslist-of)*

**get-toplevels**  
Obtains a list of all toplevel widgets of the requested types.

*args*  
*a* *<gtk-ui-manager>*

*types*  
specifies the types of toplevel widgets to include. Allowed types  
are `<gtk-ui-manager-menubar>`, `<gtk-ui-manager-toolbar>` and  
`<gtk-ui-manager-popup>`.

*ret*  
a newly-allocated of all toplevel widgets of the requested types.

Since 2.4

**gtk-ui-manager-get-action** *(self <gtk-ui-manager>)* *(path mchars)*  
⇒ *(ret <gtk-action>)*

**get-action**  
Looks up an action by following a path. See **gtk-ui-manager-get-widget** for more  
information about paths.

*args*  
*a* *<gtk-ui-manager>*

*path*  
a path

*ret*  
the action whose proxy widget is found by following the path, or `'#f'` if  
no widget was found.

Since 2.4

**gtk-ui-manager-add-ui-from-string** *(self <gtk-ui-manager>)* *(buffer mchars)*  
⇒ *(ret unsigned-int)*

**add-ui-from-string**  
Parses a string containing a UI definition and merges it with the current contents of  
**self**. An enclosing `<ui>` element is added if it is missing.

*args*  
*a* *<gtk-ui-manager>* object

*buffer*  
the string to parse

*length*  
the length of *buffer* (may be -1 if *buffer* is nul-terminated)

*error*  
return location for an error

*ret*  
The merge id for the merged UI. The merge id can be used to unmerge  
the UI with **gtk-ui-manager-remove-ui**. If an error occurred, the return  
value is 0.

Since 2.4

**gtk-ui-manager-add-ui-from-file** *(self <gtk-ui-manager>)* *(filename mchars)*  
⇒ *(ret unsigned-int)*

**add-ui-from-file**  
Parses a file containing a UI definition and merges it with the current contents of **self**.

*args*  
*a* *<gtk-ui-manager>* object
filename the name of the file to parse
error return location for an error
ret The merge id for the merged UI. The merge id can be used to unmerge the UI with `gtk-ui-manager-remove-ui`. If an error occurred, the return value is 0.

Since 2.4

\[
gtk-ui-manager-new-merge-id (self <gtk-ui-manager>) \Rightarrow (ret \text{ unsigned-int})
\]

new-merge-id
Returns an unused merge id, suitable for use with `gtk-ui-manager-add-ui`.

self a `<gtk-ui-manager>`
ret an unused merge id.

Since 2.4

\[
gtk-ui-manager-add-ui (self <gtk-ui-manager>) (merge_id unsigned-int) (path mchars) (name mchars) (action mchars) (type <gtk-ui-manager-item-type>) (top bool)
\]

add-ui
Adds a UI element to the current contents of `self`.
If `type` is `GTK_UI_MANAGER_AUTO`, GTK+ inserts a menuitem, toolitem or separator if such an element can be inserted at the place determined by `path`. Otherwise `type` must indicate an element that can be inserted at the place determined by `path`.
If `path` points to a menuitem or toolitem, the new element will be inserted before or after this item, depending on `top`.

self a `<gtk-ui-manager>`
merge-id the merge id for the merged UI, see `gtk-ui-manager-new-merge-id`
path a path
name the name for the added UI element
action the name of the action to be proxied, or `#f` to add a separator
type the type of UI element to add.
top if `#t`, the UI element is added before its siblings, otherwise it is added after its siblings.

Since 2.4

\[
gtk-ui-manager-remove-ui (self <gtk-ui-manager>) (merge_id unsigned-int)
\]

remove-ui
Unmerges the part of `self`s content identified by `merge-id`.

self a `<gtk-ui-manager>` object
merge-id a merge id as returned by `gtk-ui-manager-add-ui-from-string`

Since 2.4
**gtk-ui-manager-get-ui** (*self <gtk-ui-manager>*) ⇒ (*ret mchars*)  

Creates a UI definition of the merged UI.

- **self**  
  a <gtk-ui-manager>

- **ret**  
  A newly allocated string containing an XML representation of the merged UI.

Since 2.4

**gtk-ui-manager-ensure-update** (*self <gtk-ui-manager]*)  

Makes sure that all pending updates to the UI have been completed.

This may occasionally be necessary, since <gtk-ui-manager> updates the UI in an idle function. A typical example where this function is useful is to enforce that the menubar and toolbar have been added to the main window before showing it:

```c
gtk_container_add (GTK_CONTAINER (window), vbox);
g_signal_connect (merge, "add_widget",
                  G_CALLBACK (add_widget), vbox);
gtk_ui_manager_add_ui_from_file (merge, "my-menus");
gtk_ui_manager_add_ui_from_file (merge, "my-toolbars");
gtk_ui_manager_ensure_update (merge);
gtk_widget_show (window);
```

- **self**  
  a <gtk-ui-manager>

Since 2.4
73 GtkActionGroup

A group of actions

73.1 Overview

Actions are organised into groups. An action group is essentially a map from names to <gtk-action> objects.

All actions that would make sense to use in a particular context should be in a single group. Multiple action groups may be used for a particular user interface. In fact, it is expected that most nontrivial applications will make use of multiple groups. For example, in an application that can edit multiple documents, one group holding global actions (e.g. quit, about, new), and one group per document holding actions that act on that document (e.g. save, cut/copy/paste, etc). Each window’s menus would be constructed from a combination of two action groups.

Accelerators are handled by the GTK+ accelerator map. All actions are assigned an accelerator path (which normally has the form ‘<Actions>’/) and a shortcut is associated with this accelerator path. All menuitems and toolitems take on this accelerator path. The GTK+ accelerator map code makes sure that the correct shortcut is displayed next to the menu item.

73.2 Usage

<gtk-action-group> [Class]

Derives from <gtk-buildable>, <gobject>.

This class defines the following slots:

name A name for the action group.
sensitive Whether the action group is enabled.
visible Whether the action group is visible.

connect-proxy (arg0 <gtk-action>) (arg1 <gtk-widget>) [Signal on <gtk-action-group>]

The connect-proxy signal is emitted after connecting a proxy to an action in the group. Note that the proxy may have been connected to a different action before.

This is intended for simple customizations for which a custom action class would be too clumsy, e.g. showing tooltips for menuitems in the statusbar.

<gtk-ui-manager> proxies the signal and provides global notification just before any action is connected to a proxy, which is probably more convenient to use.

Since 2.4

disconnect-proxy (arg0 <gtk-action>) (arg1 <gtk-widget>) [Signal on <gtk-action-group>]

The disconnect-proxy signal is emitted after disconnecting a proxy from an action in the group.
<gtk-ui-manager> proxies the signal and provides global notification just before any action is connected to a proxy, which is probably more convenient to use. Since 2.4

pre-activate (arg0 <gtk-action>) [Signal on <gtk-action-group>]
The pre_activate signal is emitted just before the action in the action-group is activated.
This is intended for <gtk-ui-manager> to proxy the signal and provide global notification just before any action is activated. Since 2.4

post-activate (arg0 <gtk-action>) [Signal on <gtk-action-group>]
The post_activate signal is emitted just after the action in the action-group is activated.
This is intended for <gtk-ui-manager> to proxy the signal and provide global notification just after any action is activated. Since 2.4

gtk-action-group-new (name mchars) ⇒ (ret <gtk-action-group>) [Function]
Creates a new <gtk-action-group> object. The name of the action group is used when associating keybindings with the actions.

name the name of the action group.
ret the new <gtk-action-group>

Since 2.4

gtk-action-group-get-name (self <gtk-action-group>) [Function]
⇒ (ret mchars)
get-name [Method]
Gets the name of the action group.

action-group the action group
ret the name of the action group.

Since 2.4

gtk-action-group-get-sensitive (self <gtk-action-group>) [Function]
⇒ (ret bool)
get-sensitive [Method]
Returns ‘#t’ if the group is sensitive. The constituent actions can only be logically sensitive (see gtk-action-is-sensitive) if they are sensitive (see gtk-action-get-sensitive) and their group is sensitive.

action-group the action group
ret ‘#t’ if the group is sensitive.

Since 2.4
**gtk-action-group-set-sensitive**

```c
(gtk-action-group)
(self <gtk-action-group>)
(sensitive bool)
```

**set-sensitive**

Changes the sensitivity of `action-group`.

- `action-group`: the action group
- `sensitive`: new sensitivity

Since 2.4

**gtk-action-group-get-visible**

```c
(self <gtk-action-group>)
⇒ (ret bool)
```

**get-visible**

Returns ‘#t’ if the group is visible. The constituent actions can only be logically visible (see `gtk-action-is-visible`) if they are visible (see `gtk-action-get-visible`) and their group is visible.

- `action-group`: the action group
- `ret`: ‘#t’ if the group is visible.

Since 2.4

**gtk-action-group-set-visible**

```c
(self <gtk-action-group>)
(visibility bool)
```

**set-visible**

Changes the visible of `action-group`.

- `action-group`: the action group
- `visible`: new visibility

Since 2.4

**gtk-action-group-get-action**

```c
(self <gtk-action-group>)
(action_name mchars) ⇒ (ret <gtk-action>)
```

**get-action**

Looks up an action in the action group by name.

- `action-group`: the action group
- `action-name`: the name of the action
- `ret`: the action, or ‘#f’ if no action by that name exists

Since 2.4
gtk-action-group-list-actions (self <gtk-action-group>) ⇒ (ret glist-of)

list-actions

Lists the actions in the action group.

action-group
the action group

ret an allocated list of the action objects in the action group

Since 2.4

gtk-action-group-add-action (self <gtk-action-group>)

(add-action)

Adds an action object to the action group. Note that this function does not set up the accel path of the action, which can lead to problems if a user tries to modify the accelerator of a menuitem associated with the action. Therefore you must either set the accel path yourself with gtk-action-set-accel-path, or use 'gtk_action_group_add_action_with_accel (..., NULL)'.

action-group
the action group

action an action

Since 2.4

gtk-action-group-remove-action (self <gtk-action-group>)

(remove-action)

Removes an action object from the action group.

action-group
the action group

action an action

Since 2.4

gtk-action-group-add-actions (self <gtk-action-group>)

(add-actions)

This is a convenience function to create a number of actions and add them to the action group.

The "activate" signals of the actions are connected to the callbacks and their accel paths are set to '<Actions>://'.

action-group
The action group

scm An list of actions. The actions are of the form (name stock-id label accelerator tooltip proc?). All values are strings except the proc, which should be a procedure suitable for connecting to the activate
signal on the action. *stock-id, label, accelerator, tooltip, and proc may be #f.*

Since 2.4

gtk-action-group-add-toggle-actions (self <gtk-action-group>)  [Function]
(entries scm)  
add-toggle-actions  [Method]
This is a convenience function to create a number of toggle actions and add them to the action group.

The "activate" signals of the actions are connected to the callbacks and their accel paths are set to `<Actions>/group-name/action-name`.

  *action-group*  
  the action group

  *entries*  
  an array of toggle action descriptions

  *n-entries*  
  the number of entries

  *user-data*  
  data to pass to the action callbacks

Since 2.4

gtk-action-group-add-radio-actions (self <gtk-action-group>)  [Function]
(entries scm) (value int) (on_change scm)  
add-radio-actions  [Method]
This is a convenience routine to create a group of radio actions and add them to the action group.

The "changed" signal of the first radio action is connected to the on-change callback and the accel paths of the actions are set to `<Actions>/group-name/action-name`.

  *action-group*  
  the action group

  *entries*  
  an array of radio action descriptions

  *n-entries*  
  the number of entries

  *value*  
  the value of the action to activate initially, or -1 if no action should be activated

  *on-change*  
  the callback to connect to the changed signal

  *user-data*  
  data to pass to the action callbacks

Since 2.4

gtk-action-group-translate-string (self <gtk-action-group>)  [Function]
(string mchars) ⇒ (ret mchars)  
translate-string  [Method]
Translates a string using the specified translate-func. This is mainly intended for language bindings.

  *action-group*  
  a <gtk-action-group>
**string**  a string

**ret**  the translation of **string**

Since 2.6
# 74 GtkAction

An action which can be triggered by a menu or toolbar item

## 74.1 Overview

Actions represent operations that the user can be perform, along with some information how it should be presented in the interface. Each action provides methods to create icons, menu items and toolbar items representing itself.

As well as the callback that is called when the action gets activated, the following also gets associated with the action: The action will also have some state information:

- a name (not translated, for path lookup)
- a label (translated, for display)
- an accelerator
- whether label indicates a stock id
- a tooltip (optional, translated)
- a toolbar label (optional, shorter than label)
- visible (shown/hidden)
- sensitive (enabled/disabled)

Apart from regular actions, there are toggle actions, which can be toggled between two states and radio actions, of which only one in a group can be in the "active" state. Other actions can be implemented as `<gtk-action>` subclasses.

Each action can have one or more proxy menu item, toolbar button or other proxy widgets. Proxies mirror the state of the action (text label, tooltip, icon, visible, sensitive, etc), and should change when the action’s state changes. When the proxy is activated, it should activate its action.

## 74.2 Usage

```xml
<gtk-action>
  Derives from `<gtk-buildable>`, `<gobject>`.
  This class defines the following slots:
  name    A unique name for the action.
  label   The label used for menu items and buttons that activate this action.
  short-label
           A shorter label that may be used on toolbar buttons.
  tooltip A tooltip for this action.
  stock-id The stock icon displayed in widgets representing this action.
  icon-name
            The name of the icon from the icon theme
</gtk-action>
```

[Class]
visible-horizontal
   Whether the toolbar item is visible when the toolbar is in a horizontal orientation.

visible-vertical
   Whether the toolbar item is visible when the toolbar is in a vertical orientation.

visible-overflown
   When TRUE, toolitem proxies for this action are represented in the toolbar overflow menu.

is-important
   Whether the action is considered important. When TRUE, toolitem proxies for this action show text in GTK_TOOLBAR_BOTH_HORIZ mode.

hide-if-empty
   When TRUE, empty menu proxies for this action are hidden.

sensitive
   Whether the action is enabled.

visible
   Whether the action is visible.

action-group
   The GtkActionGroup this GtkAction is associated with, or NULL (for internal use).

activate
   The "activate" signal is emitted when the action is activated.

Since 2.4

gtk-action-new (name mchars) (label mchars) (tooltip mchars) (stock_id mchars) ⇒ (ret <gtk-action>)
   Creates a new <gtk-action> object. To add the action to a <gtk-action-group> and set the accelerator for the action, call gtk-action-group-add-action-with-accel.

See (the missing figure, XML-UI for information on allowed action names.

name
   A unique name for the action

label
   the label displayed in menu items and on buttons

tooltip
   a tooltip for the action

stock-id
   the stock icon to display in widgets representing the action

ret
   a new <gtk-action>

Since 2.4

gtk-action-get-name (self <gtk-action>) ⇒ (ret mchars)
   Returns the name of the action.

action
   the action object
the name of the action. The string belongs to GTK+ and should not be freed.

Since 2.4

\[ \text{gtk-action-is-sensitive} \ (self \ <\text{gtk-action}>) \Rightarrow \ (ret \ bool) \]  
\text{is-sensitive}  
Returns whether the action is effectively sensitive.

\begin{itemize}
\item \text{action} \quad \text{the action object}
\item \text{ret} \quad \text{‘#t’ if the action and its associated action group are both sensitive.}
\end{itemize}

Since 2.4

\[ \text{gtk-action-get-sensitive} \ (self \ <\text{gtk-action}>) \Rightarrow \ (ret \ bool) \]  
\text{get-sensitive}  
Returns whether the action itself is sensitive. Note that this doesn’t necessarily mean effective sensitivity. See \text{gtk-action-is-sensitive} for that.

\begin{itemize}
\item \text{action} \quad \text{the action object}
\item \text{ret} \quad \text{‘#t’ if the action itself is sensitive.}
\end{itemize}

Since 2.4

\[ \text{gtk-action-set-sensitive} \ (self \ <\text{gtk-action}>) \ (sensitive \ bool) \]  
\text{set-sensitive}  
Sets the ::sensitive property of the action to \text{sensitive}. Note that this doesn’t necessarily mean effective sensitivity. See \text{gtk-action-is-sensitive} for that.

\begin{itemize}
\item \text{action} \quad \text{the action object}
\item \text{sensitive} \quad \text{‘#t’ to make the action sensitive}
\end{itemize}

Since 2.6

\[ \text{gtk-action-is-visible} \ (self \ <\text{gtk-action}>) \Rightarrow \ (ret \ bool) \]  
\text{is-visible}  
Returns whether the action is effectively visible.

\begin{itemize}
\item \text{action} \quad \text{the action object}
\item \text{ret} \quad \text{‘#t’ if the action and its associated action group are both visible.}
\end{itemize}

Since 2.4

\[ \text{gtk-action-get-visible} \ (self \ <\text{gtk-action}>) \Rightarrow \ (ret \ bool) \]  
\text{get-visible}  
Returns whether the action itself is visible. Note that this doesn’t necessarily mean effective visibility. See \text{gtk-action-is-sensitive} for that.

\begin{itemize}
\item \text{action} \quad \text{the action object}
\item \text{ret} \quad \text{‘#t’ if the action itself is visible.}
\end{itemize}

Since 2.4
gtk-action-set-visible (self <gtk-action>) (visible bool)
set-visible
Sets the ::visible property of the action to visible. Note that this doesn’t necessarily mean effective visibility. See gtk-action-is-visible for that.

action the action object
visible ‘#t’ to make the action visible

Since 2.6

gtk-action-activate (self <gtk-action>)
activate
Emits the "activate" signal on the specified action, if it isn’t insensitive. This gets called by the proxy widgets when they get activated.

It can also be used to manually activate an action.

action the action object

Since 2.4

gtk-action-create-icon (self <gtk-action>)
create-icon
This function is intended for use by action implementations to create icons displayed in the proxy widgets.

action the action object
icon-size the size of the icon that should be created.
ret a widget that displays the icon for this action.

Since 2.4

gtk-action-create-menu-item (self <gtk-action>)
create-menu-item
Creates a menu item widget that proxies for the given action.

action the action object
ret a menu item connected to the action.

Since 2.4

gtk-action-create-tool-item (self <gtk-action>)
create-tool-item
Creates a toolbar item widget that proxies for the given action.

action the action object
ret a toolbar item connected to the action.

Since 2.4

**gtk-action-connect-proxy** *(self <gtk-action>)*  
( *proxy* <gtk-widget>*))*  

**connect-proxy**  
[Method]  
Connects a widget to an action object as a proxy. Synchronises various properties of the action with the widget (such as label text, icon, tooltip, etc), and attaches a callback so that the action gets activated when the proxy widget does.  
If the widget is already connected to an action, it is disconnected first.  

*action* the action object  
*proxy* the proxy widget  

Since 2.4

**gtk-action-disconnect-proxy** *(self <gtk-action>)*  
( *proxy* <gtk-widget>*))*  

**disconnect-proxy**  
[Method]  
Disconnects a proxy widget from an action. Does not destroy the widget, however.  

*action* the action object  
*proxy* the proxy widget  

Since 2.4

**gtk-action-get-proxies** *(self <gtk-action>)* ⇒ ( *ret* gslist-of)  

**get-proxies**  
[Method]  
Returns the proxy widgets for an action. See also gtk-widget-get-action.  

*action* a <gs-list> of proxy widgets. The list is owned by GTK+ and must not be modified.  

Since 2.4

**gtk-action-connect-accelerator** *(self <gtk-action>)*  

**connect-accelerator**  
[Method]  
Installs the accelerator for *action* if *action* has an accel path and group. See gtk-action-set-accel-path and gtk-action-set-accel-group  
Since multiple proxies may independently trigger the installation of the accelerator, the *action* counts the number of times this function has been called and doesn’t remove the accelerator until gtk-action-disconnect-accelerator has been called as many times.  

*action* a <gtk-action>*

Since 2.4

**gtk-action-disconnect-accelerator** *(self <gtk-action>)*  

**disconnect-accelerator**  
[Method]  
Undoes the effect of one call to gtk-action-connect-accelerator.  

*action* a <gtk-action>*

Since 2.4
gtk-action-block-activate-from (self <gtk-action>) \[Function\] 
(\text{proxy} <\text{gtk-widget}>) \[Method\] 
Disables calls to the gtk-action-activate function by signals on the given proxy widget. This is used to break notification loops for things like check or radio actions. 
This function is intended for use by action implementations. 
\text{action} \quad \text{the action object} \[\text{proxy} \quad \text{a proxy widget} \] 
Since 2.4

gtk-action-unblock-activate-from (self <gtk-action>) \[Function\] 
(\text{proxy} <\text{gtk-widget}>) \[Method\] 
Re-enables calls to the gtk-action-activate function by signals on the given proxy widget. This undoes the blocking done by gtk-action-block-activate-from. 
This function is intended for use by action implementations. 
\text{action} \quad \text{the action object} \[\text{proxy} \quad \text{a proxy widget} \] 
Since 2.4

gtk-action-get-accel-path (self <gtk-action>) ⇒ (ret mchars) \[Function\] 
get-accel-path \[Method\] 
Returns the accel path for this action. 
\text{action} \quad \text{the action object} \[\text{ret} \quad \text{the accel path for this action, or ‘#f’ if none is set. The returned string is owned by GTK± and must not be freed or modified.}\] 
Since 2.6

gtk-action-set-accel-path (self <gtk-action>) \[Function\] 
(set-accel-path mchars) \[Method\] 
Sets the accel path for this action. All proxy widgets associated with the action will have this accel path, so that their accelerators are consistent. 
\text{action} \quad \text{the action object} \[\text{accel-path} \quad \text{the accelerator path}\] 
Since 2.4

gtk-action-get-accel-closure (self <gtk-action>) ⇒ (ret <gclosure>) \[Function\] 
get-accel-closure \[Method\] 
Returns the accel closure for this action. 
\text{action} \quad \text{the action object}
the accel closure for this action. The returned closure is owned by GTK+
and must not be unrefed or modified.

Since 2.8

```c
gtk-action-set-accel-group (self <gtk-action>)
(accel_group <gtk-accel-group>)
```

[Function]

Sets the `<gtk-accel-group>` in which the accelerator for this action will be installed.

- **action**: the action object
- **accel-group**: a `<gtk-accel-group>` or ‘#f’

Since 2.4
75 GtkToggleAction

An action which can be toggled between two states

75.1 Overview

A `<gtk-toggle-action>` corresponds roughly to a `<gtk-check-menu-item>`. It has an "active" state specifying whether the action has been checked or not.

75.2 Usage

```xml
<gtk-toggle-action>  [Class]
    Derives from `<gtk-action>`. This class defines the following slots:
    draw-as-radio
        Whether the proxies for this action look like radio action proxies
    active
        If the toggle action should be active in or not
    toggled  [Signal on `<gtk-toggle-action>`]
  gtk-toggle-action-new (name mchars) (label mchars)
      (tooltip mchars) (stock_id mchars) ⇒ (ret `<gtk-toggle-action>`)  [Function]
  Creates a new `<gtk-toggle-action>` object. To add the action to a `<gtk-action-group>` and set the accelerator for the action, call `gtk-action-group-add-action-with-accel`.
    name
        A unique name for the action
    label
        The label displayed in menu items and on buttons
    tooltip
        A tooltip for the action
    stock-id
        The stock icon to display in widgets representing the action
    ret
        a new `<gtk-toggle-action>`
Since 2.4
  gtk-toggle-action-toggled (self `<gtk-toggle-action>`)  [Function]
    toggled  [Method]
    Emits the "toggled" signal on the toggle action.
    action
        the action object
Since 2.4
  gtk-toggle-action-set-active (self `<gtk-toggle-action>`)  [Function]
    (is_active bool)
    set-active  [Method]
    Sets the checked state on the toggle action.
    action
        the action object
    is-active
        whether the action should be checked or not
Since 2.4
```
**Chapter 75: GtkToggleAction**

```c
gtk-toggle-action-get-active (self <gtk-toggle-action>) ⇒ (ret bool)
```

**get-active**

Returns the checked state of the toggle action.

- **action** the action object
- **ret** the checked state of the toggle action

Since 2.4

```c
gtk-toggle-action-set-draw-as-radio (self <gtk-toggle-action>) (draw_as_radio bool)
```

**set-draw-as-radio**

Sets whether the action should have proxies like a radio action.

- **action** the action object
- **draw-as-radio** whether the action should have proxies like a radio action

Since 2.4

```c
gtk-toggle-action-get-draw-as-radio (self <gtk-toggle-action>) ⇒ (ret bool)
```

**get-draw-as-radio**

Returns whether the action should have proxies like a radio action.

- **action** the action object
- **ret** whether the action should have proxies like a radio action.

Since 2.4
76 GtkRadioAction

An action of which only one in a group can be active

76.1 Overview

A <gtk-radio-action> is similar to <gtk-radio-menu-item>. A number of radio actions can be linked together so that only one may be active at any one time.

76.2 Usage

<gtk-radio-action> [Class]

Derives from <gtk-toggle-action>.

This class defines the following slots:

- **value**: The value returned by gtk_radio_action_get_current_value() when this action is the current action of its group.
- **group**: The radio action whose group this action belongs to.
- **current-value**: The value property of the currently active member of the group to which this action belongs.

```
changed (arg0 <gtk-radio-action>) [Signal on <gtk-radio-action>]
```

The ::changed signal is emitted on every member of a radio group when the active member is changed. The signal gets emitted after the ::activate signals for the previous and current active members.

Since 2.4

```
gtk-radio-action-new (name mchars) (label mchars) (tooltip mchars) (stock_id mchars) (value int) \Rightarrow (ret <gtk-radio-action>) [Function]
```

Creates a new <gtk-radio-action> object. To add the action to a <gtk-action-group> and set the accelerator for the action, call gtk-action-group-add-action-with-accel.

- **name**: A unique name for the action
- **label**: The label displayed in menu items and on buttons
- **tooltip**: A tooltip for this action
- **stock-id**: The stock icon to display in widgets representing this action
- **value**: The value which gtk-radio-action-get-current-value should return if this action is selected.
- **ret**: a new <gtk-radio-action>

Since 2.4
get-radio-action-get-group (self<gtk-radio-action>) ⇒ (ret<gtk-radio-group*>)

get-group [Method]
Returns the list representing the radio group for this object. Note that the returned list is only valid until the next change to the group.
A common way to set up a group of radio group is the following:

```c
GList *group = NULL;
GtkRadioAction *action;

while (/* more actions to add */) {
    action = gtk_radio_action_new (...);
    gtk_radio_action_set_group (action, group);
    group = gtk_radio_action_get_group (action);
}
```

`action` the action object
`ret` the list representing the radio group for this object

Since 2.4

gtk-radio-action-set-group (self<gtk-radio-action>)
(set-group<gtk-radio-group*>)

set-group [Method]
Sets the radio group for the radio action object.
`action` the action object
`group` a list representing a radio group

Since 2.4

gtk-radio-action-get-current-value (self<gtk-radio-action>) ⇒ (ret int)

get-current-value [Method]
Obtains the value property of the currently active member of the group to which `action` belongs.
`action` a <gtk-radio-action>
`ret` The value of the currently active group member

Since 2.4

gtk-radio-action-set-current-value (self<gtk-radio-action>)
(set-current-value current_value int)

set-current-value [Method]
Sets the currently active group member to the member with value property `current_value`. 
action  a `<gtk-radio-action>`

current-value  the new value

Since 2.10
77 GtkColorButton

A button to launch a color selection dialog

77.1 Overview

The <gtk-color-button> is a button which displays the currently selected color and allows to open a color selection dialog to change the color. It is a suitable widget for selecting a color in a preference dialog.

77.2 Usage

<gtk-color-button> [Class]
Derives from <gtk-button>.
This class defines the following slots:

- use-alpha Whether or not to give the color an alpha value
- title The title of the color selection dialog
- color The selected color
- alpha The selected opacity value (0 fully transparent, 65535 fully opaque)

color-set [Signal on <gtk-color-button>]
The ::color-set signal is emitted when the user selects a color. When handling this signal, use gtk-color-button-get-color and gtk-color-button-get-alpha to find out which color was just selected.

Note that this signal is only emitted when the user changes the color. If you need to react to programmatic color changes as well, use the notify::color signal.

Since 2.4

gtk-color-button-new ⇒ (ret <gtk-widget>) [Function]
Creates a new color button. This returns a widget in the form of a small button containing a swatch representing the current selected color. When the button is clicked, a color-selection dialog will open, allowing the user to select a color. The swatch will be updated to reflect the new color when the user finishes.

ret a new color button.

Since 2.4

gtk-color-button-new-with-color (color <gdk-color>) ⇒ (ret <gtk-widget>) [Function]
Creates a new color button.

color A <gdk-color> to set the current color with.
ret a new color button.

Since 2.4
### gtk-color-button-set-color

*Function*

\[
\text{gtk-color-button-set-color} \quad (self \; <\text{gtk-color-button}> \quad (color \; <\text{gdk-color}>))
\]

**set-color**

Sets the current color to be \textit{color}.

\begin{itemize}
  \item \textit{color-button} a \langle\text{gtk-color-button}\rangle.
  \item \textit{color} A \langle\text{gdk-color}\rangle to set the current color with.
\end{itemize}

Since 2.4

### gtk-color-button-get-color

*Function*

\[
\text{gtk-color-button-get-color} \quad (self \; <\text{gtk-color-button}> \quad (color \; <\text{gdk-color}>))
\]

**get-color**

Sets \textit{color} to be the current color in the \langle\text{gtk-color-button}\rangle widget.

\begin{itemize}
  \item \textit{color-button} a \langle\text{gtk-color-button}\rangle.
  \item \textit{color} a \langle\text{gdk-color}\rangle to fill in with the current color.
\end{itemize}

Since 2.4

### gtk-color-button-set-alpha

*Function*

\[
\text{gtk-color-button-set-alpha} \quad (self \; <\text{gtk-color-button}> \quad (alpha \; \text{unsigned-int16}))
\]

**set-alpha**

Sets the current opacity to be \textit{alpha}.

\begin{itemize}
  \item \textit{color-button} a \langle\text{gtk-color-button}\rangle.
  \item \textit{alpha} an integer between 0 and 65535.
\end{itemize}

Since 2.4

### gtk-color-button-get-alpha

*Function*

\[
\text{gtk-color-button-get-alpha} \quad (self \; <\text{gtk-color-button}> \quad \Rightarrow \; (ret \; \text{unsigned-int16}))
\]

**get-alpha**

Returns the current alpha value.

\begin{itemize}
  \item \textit{color-button} a \langle\text{gtk-color-button}\rangle.
  \item \textit{ret} an integer between 0 and 65535.
\end{itemize}

Since 2.4

### gtk-color-button-set-use-alpha

*Function*

\[
\text{gtk-color-button-set-use-alpha} \quad (self \; <\text{gtk-color-button}> \quad (use\_alpha \; \text{bool}))
\]

**set-use-alpha**

Sets whether or not the color button should use the alpha channel.

\begin{itemize}
  \item \textit{color-button} a \langle\text{gtk-color-button}\rangle.
\end{itemize}
Chapter 77: GtkColorButton

use-alpha  ‘#t’ if color button should use alpha channel, ‘#f’ if not.

Since 2.4

gtk-color-button-get-use-alpha (self <gtk-color-button>)  [Function]
⇒ (ret bool)
go get-use-alpha  [Method]
Does the color selection dialog use the alpha channel?

color-button
   a <gtk-color-button>.
ret  ‘#t’ if the color sample uses alpha channel, ‘#f’ if not.

Since 2.4

gtk-color-button-set-title (self <gtk-color-button>)  [Function]
   (title mchars)
set-title  [Method]
Sets the title for the color selection dialog.

color-button
   a <gtk-color-button>
title    String containing new window title.

Since 2.4

gtk-color-button-get-title (self <gtk-color-button>)  [Function]
⇒ (ret mchars)
go get-title  [Method]
Gets the title of the color selection dialog.

color-button
   a <gtk-color-button>
ret        An internal string, do not free the return value

Since 2.4
Chapter 78: GtkColorSelection

78 GtkColorSelection

A widget used to select a color

78.1 Overview

The <gtk-color-selection> is a widget that is used to select a color. It consists of a color wheel and number of sliders and entry boxes for color parameters such as hue, saturation, value, red, green, blue, and opacity. It is found on the standard color selection dialog box <gtk-color-selection-dialog>.

78.2 Usage

<gtk-color-selection> [Class]
Derives from <gtk-vbox>.
This class defines the following slots:

has-palette
Whether a palette should be used

has-opacity-control
Whether the color selector should allow setting opacity

current-color
The current color

current-alpha
The current opacity value (0 fully transparent, 65535 fully opaque)

color-changed [Signal on <gtk-color-selection>]
This signal is emitted when the color changes in the <gtk-color-selection> according to its update policy.

gtk-color-selection-new ⇒ (ret <gtk-widget>) [Function]
Creates a new GtkColorSelection.

ret a new <gtk-color-selection>

gtk-color-selection-set-has-palette [Function]
(set self <gtk-color-selection>) (has_palette bool)
set-has-palette
Shows and hides the palette based upon the value of has-palette.

colorsel a <gtk-color-selection>.

has-palette
‘#t’ if palette is to be visible, ‘#f’ otherwise.

gtk-color-selection-get-has-palette [Function]
(set self <gtk-color-selection>) ⇒ (ret bool)
get-has-palette
Determines whether the color selector has a color palette.
Chapter 78: GtkColorSelection

```plaintext
colorsel  a <gtk-color-selection>.
ret  't' if the selector has a palette. 'f' if it hasn’t.
```

gtk-color-selection-is-adjusting (self <gtk-color-selection>)  [Function]
⇒ (ret bool)

is-adjusting  [Method]

Gets the current state of the colorsel.

```plaintext
colorsel  a <gtk-color-selection>.
ret  't' if the user is currently dragging a color around, and 'f' if the selection has stopped.
```
79 GtkColorSelectionDialog

A standard dialog box for selecting a color

79.1 Overview

The <gtk-color-selection-dialog> provides a standard dialog which allows the user to select a color much like the <gtk-file-selection> provides a standard dialog for file selection.

79.2 Usage

<gtk-color-selection-dialog> [Class]

Derives from <gtk-dialog>.

This class defines no direct slots.

gtk-color-selection-dialog-new (title mchars) [Function]

⇒ (ret <gtk-widget>)

Creates a new <gtk-color-selection-dialog>.

title a string containing the title text for the dialog.

ret a <gtk-color-selection-dialog>.
80 GtkFileSelection

Prompt the user for a file or directory name

80.1 Overview

<gtk-file-selection> should be used to retrieve file or directory names from the user. It will create a new dialog window containing a directory list, and a file list corresponding to the current working directory. The filesystem can be navigated using the directory list or the drop-down history menu. Alternatively, the TAB key can be used to navigate using filename completion - common in text based editors such as emacs and jed.

File selection dialogs are created with a call to gtk-file-selection-new. The default filename can be set using gtk-file-selection-set-filename and the selected filename retrieved using gtk-file-selection-get-filename.

Use gtk-file-selection-complete to display files and directories that match a given pattern. This can be used for example, to show only *.txt files, or only files beginning with gtk*.

Simple file operations; create directory, delete file, and rename file, are available from buttons at the top of the dialog. These can be hidden using gtk-file-selection-hide-fileop-buttons and shown again using gtk-file-selection-show-fileop-buttons.

```c
/* The file selection widget and the string to store the chosen filename */

void store_filename (GtkWidget *widget, gpointer user_data) {
    GtkWidget *file_selector = GTK_WIDGET (user_data);
    const gchar *selected_filename;

    selected_filename = gtk_file_selection_get_filename (GTK_FILE_SELECTION (file_selector));
    g_print ("Selected filename: %s\n", selected_filename);
}

void create_file_selection (void) {

    GtkWidget *file_selector;
    /* Create the selector */

    file_selector = gtk_file_selection_new ("Please select a file for editing.");
    g_signal_connect (GTK_FILE_SELECTION (file_selector)->ok_button, "clicked",
    G_CALLBACK (filename),
    file_selector);

    /* Ensure that the dialog box is destroyed when the user clicks a button. */
```
g_signal_connect_swapped (GTK_FILE_SELECTION (file_selector)->ok_button, "clicked",
G_CALLBACK (gtk_widget_destroy),
file_selector);

g_signal_connect_swapped (GTK_FILE_SELECTION (file_selector)->cancel_button, "clicked",
G_CALLBACK (gtk_widget_destroy),
file_selector);

/* Display that dialog */

gtk_widget_show (file_selector);
}

80.2 Usage

<gtk-file-selection> [Class]
Derives from <gtk-dialog>.
This class defines the following slots:

  show-fileops
  Whether buttons for creating/manipulating files should be displayed

  filename
  The currently selected filename

  select-multiple
  Whether to allow multiple files to be selected

gtk-file-selection-new (title mchars) ⇒ (ret <gtk-widget>) [Function]
Creates a new file selection dialog box. By default it will contain a <gtk-tree-view>
of the application’s current working directory, and a file listing. Operation buttons
that allow the user to create a directory, delete files and rename files, are also present.

  title
  a message that will be placed in the file requestor’s titlebar.

  ret
  the new file selection.

gtk-file-selection-set-filename (self <gtk-file-selection>) [Function]
  (filename mchars)
set-filename [Method]
Sets a default path for the file requestor. If filename includes a directory path, then
the requestor will open with that path as its current working directory.

This has the consequence that in order to open the requestor with a working directory
and an empty filename, filename must have a trailing directory separator.

The encoding of filename is preferred GLib file name encoding, which may not be
UTF-8. See g-filename-from-utf8.
filesel  a `<gtk-file-selection>`.
filename a string to set as the default file name.

gtk-file-selection-get-filename (self <gtk-file-selection>)  [Function]
⇒ (ret mchars)
get-filename  [Method]
This function returns the selected filename in the GLib file name encoding. To convert to UTF-8, call `g-filename-to-utf8`. The returned string points to a statically allocated buffer and should be copied if you plan to keep it around.

If no file is selected then the selected directory path is returned.

filesel  a `<gtk-file-selection>`
ret currently-selected filename in the on-disk encoding.

gtk-file-selection-complete (self <gtk-file-selection>)  [Function]
(pattern mchars)
complete  [Method]
Will attempt to match `pattern` to a valid filenames or subdirectories in the current directory. If a match can be made, the matched filename will appear in the text entry field of the file selection dialog. If a partial match can be made, the "Files" list will contain those file names which have been partially matched, and the "Folders" list those directories which have been partially matched.

filesel  a `<gtk-file-selection>`.

pattern a string of characters which may or may not match any filenames in the current directory.
81 GtkFileChooser

File chooser interface used by GtkFileChooserWidget and GtkFileChooserDialog

81.1 Overview

<gtk-file-chooser> is an interface that can be implemented by file selection widgets. In GTK+, the main objects that implement this interface are <gtk-file-chooser-widget>, <gtk-file-chooser-dialog>, and <gtk-file-chooser-button>. You do not need to write an object that implements the <gtk-file-chooser> interface unless you are trying to adapt an existing file selector to expose a standard programming interface.

<gtk-file-chooser> allows for shortcuts to various places in the filesystem. In the default implementation these are displayed in the left pane. It may be a bit confusing that these shortcuts come from various sources and in various flavours, so let's explain the terminology here:

**Shortcuts**

- Volumes
  - are created by the user, by dragging folders from the right pane to the left pane, or by using the "Add". Bookmarks can be renamed and deleted by the user.
  - can be provided by the application or by the underlying filesystem abstraction (e.g., both the gnome-vfs and the Windows filesystems provide "Desktop" shortcuts). Shortcuts cannot be modified by the user.
  - are provided by the underlying filesystem abstraction. They are the "roots" of the filesystem.

**Volumes**

- are created by the user, by dragging folders from the right pane to the left pane, or by using the "Add". Bookmarks can be renamed and deleted by the user.

81.2 File Names and Encodings

When the user is finished selecting files in a <gtk-file-chooser>, your program can get the selected names either as filenames or as URIs. For URIs, the normal escaping rules are applied if the URI contains non-ASCII characters. However, filenames are always returned in the character set specified by the G_FILENAME_ENCODING environment variable. Please see the Glib documentation for more details about this variable.

This means that while you can pass the result of gtk-file-chooser-get-filename to open(2) or fopen(3), you may not be able to directly set it as the text of a <gtk-label> widget unless you convert it first to UTF-8, which all GTK+ widgets expect. You should use g-filename-to-utf8 to convert filenames into strings that can be passed to GTK+ widgets.

81.3 Adding a Preview Widget

You can add a custom preview widget to a file chooser and then get notification about when the preview needs to be updated. To install a preview widget, use gtk-file-chooser-set-preview-widget. Then, connect to the <gtk-file-chooser::update-preview> signal to get notified when you need to update the contents of the preview.

Your callback should use gtk-file-chooser-get-preview-filename to see what needs previewing. Once you have generated the preview for the corresponding file, you must
call `gtk-file-chooser-set-preview-widget-active` with a boolean flag that indicates whether your callback could successfully generate a preview.

```c
{  
    GtkWidget *preview;

    ... 

    preview = gtk_image_new ();

    gtk_file_chooser_set_preview_widget (my_file_chooser, preview);
    g_signal_connect (my_file_chooser, "update-preview",
                      G_CALLBACK (update_preview_cb), preview);
}

static void update_preview_cb (GtkFileChooser *file_chooser, gpointer data)
{
    GtkWidget *preview;
    char *filename;
    GdkPixbuf *pixbuf;
    gboolean have_preview;

    preview = GTK_WIDGET (data);
    filename = gtk_file_chooser_get_preview_filename (file_chooser);

    pixbuf = gdk_pixbuf_new_from_file_at_size (filename, 128, 128, NULL);
    have_preview = (pixbuf != NULL);
    g_free (filename);

    gtk_image_set_from_pixbuf (GTK_IMAGE (preview), pixbuf);
    if (pixbuf)
        gobject_unref (pixbuf);

    gtk_file_chooser_set_preview_widget_active (file_chooser, have_preview);
}
```

81.4 Adding Extra Widgets

You can add extra widgets to a file chooser to provide options that are not present in the default design. For example, you can add a toggle button to give the user the option to open a file in read-only mode. You can use `gtk-file-chooser-set-extra-widget` to insert additional widgets in a file chooser.

```c
{  
    GtkWidget *toggle;
```
Chapter 81: GtkFileChooser

... 

toggle = gtk_check_button_new_with_label ("Open file read-only");
gtk_widget_show (toggle);
gtk_file_chooser_set_extra_widget (my_file_chooser, toggle);
}

If you want to set more than one extra widget in the file chooser, you can a container such as a GtkVBox or a GtkTable and include your widgets in it. Then, set the container as the whole extra widget.

81.5 Key Bindings

Internally, GTK+ implements a file chooser's graphical user interface with the private . This widget has several key bindings and their associated signals. This section describes the available key binding signals.

The default keys that activate the key-binding signals in are as follows:

Both the individual key and the numeric keypad’s "divide" key are supported.
Both the individual Up key and the numeric keypad’s Up key are supported.

You can change these defaults to something else. For example, to add a modifier to a few of the default bindings, you can include the following fragment in your '.gtkrc-2.0' file:

binding "my-own-gtkfilechooser-bindings" {
  bind "<Alt><Shift>Up" {
    "up-folder" ()
  }
  bind "<Alt><Shift>Down" {
    "down-folder" ()
  }
  bind "<Alt><Shift>Home" {
    "home-folder" ()
  }
}

class "GtkFileChooserDefault" binding "my-own-gtkfilechooser-bindings"

81.5.1 The "GtkFileChooserDefault::location-popup" signal

    void user_function (GtkFileChooserDefault *chooser,
                         const char *path,
                         gpointer user_data);
This is used to make the file chooser show a "Location" dialog which the user can use to manually type the name of the file he wishes to select. The path argument is a string that gets put in the text entry for the file name. By default this is bound to with a path string of "" (the empty string). It is also bound to with a path string of "/" (a slash): this lets you type and immediately type a path name. On Unix systems, this is bound to (tilde) with a path string of "/~" itself for access to home directories.

`chooser`  the object which received the signal.
`path`  default contents for the text entry for the file name
`user-data`  user data set when the signal handler was connected.

You can create your own bindings for the signal with custom path strings, and have a crude form of easily-to-type bookmarks. For example, say you access the path `/home/username/misc` very frequently. You could then create an shortcut by including the following in your `.gtkrc-2.0`:

```xml
binding "misc-shortcut" {
    bind "<Alt>M" {
        "location-popup" ("/home/username/misc")
    }
}
```

This is used to make the file chooser go to the parent of the current folder in the file hierarchy. By default this is bound to and (the Up key in the numeric keypad also works).

`chooser`  the object which received the signal.
`user-data`  user data set when the signal handler was connected.

This is used to make the file chooser go to a child of the current folder in the file hierarchy. The subfolder that will be used is displayed in the path bar widget of the file chooser. For example, if the path bar is showing "/foo/bar/baz", then this will cause the file chooser to switch to the "baz" subfolder. By default this is bound to (the Down key in the numeric keypad also works).
81.5.4 The "GtkFileChooserDefault::home-folder" signal

```c
void user_function (GtkFileChooserDefault *chooser,
                   gpointer user_data);
```

This is used to make the file chooser show the user’s home folder in the file list. By default this is bound to (the Home key in the numeric keypad also works).

81.5.5 The "GtkFileChooserDefault::desktop-folder" signal

```c
void user_function (GtkFileChooserDefault *chooser,
                   gpointer user_data);
```

This is used to make the file chooser show the user’s Desktop folder in the file list. By default this is bound to .

81.5.6 The "GtkFileChooserDefault::quick-bookmark" signal

```c
void user_function (GtkFileChooserDefault *chooser,
                   gint bookmark_index,
                   gpointer user_data);
```

This is used to make the file chooser switch to the bookmark specified in the bookmark-index parameter. For example, if you have three bookmarks, you can pass 0, 1, 2 to this signal to switch to each of them, respectively. By default this is bound to , , etc. until . Note that in the default binding, that is actually defined to switch to the bookmark at index 0, and so on successively; is defined to switch to the bookmark at index 10.

---

*chooser* the object which received the signal.

*user-data* user data set when the signal handler was connected.

*bookmark-index* index of the bookmark to switch to; the indices start at 0.

*user-data* user data set when the signal handler was connected.
**81.6 Usage**

<gtk-file-chooser> [Class]

Derives from <ginterface>.

This class defines the following slots:

* **filter**
  The current filter for selecting which files are displayed

* **local-only**
  Whether the selected file(s) should be limited to local file: URLs

* **use-preview-label**
  Whether to display a stock label with the name of the previewed file.

* **preview-widget-active**
  Whether the application supplied widget for custom previews should be shown.

* **preview-widget**
  Application supplied widget for custom previews.

* **show-hidden**
  Whether the hidden files and folders should be displayed

* **do-overwrite-confirmation**
  Whether a file chooser in save mode will present an overwrite confirmation dialog if necessary.

* **extra-widget**
  Application supplied widget for extra options.

* **file-system-backend**
  Name of file system backend to use

* **action**
  The type of operation that the file selector is performing

* **select-multiple**
  Whether to allow multiple files to be selected

**current-folder-changed** [Signal on <gtk-file-chooser>]

This signal is emitted when the current folder in a <gtk-file-chooser> changes. This can happen due to the user performing some action that changes folders, such as selecting a bookmark or visiting a folder on the file list. It can also happen as a result of calling a function to explicitly change the current folder in a file chooser.

Normally you do not need to connect to this signal, unless you need to keep track of which folder a file chooser is showing.

**selection-changed** [Signal on <gtk-file-chooser>]

This signal is emitted when there is a change in the set of selected files in a <gtk-file-chooser>. This can happen when the user modifies the selection with the mouse or the keyboard, or when explicitly calling functions to change the selection.
Normally you do not need to connect to this signal, as it is easier to wait for the file chooser to finish running, and then to get the list of selected files using the functions mentioned below.

**update-preview**  
[Signal on <gtk-file-chooser>]

This signal is emitted when the preview in a file chooser should be regenerated. For example, this can happen when the currently selected file changes. You should use this signal if you want your file chooser to have a preview widget.

Once you have installed a preview widget with gtk-file-chooser-set-preview-widget, you should update it when this signal is emitted. You can use the functions gtk-file-chooser-get-preview-filename or gtk-file-chooser-get-preview-uri to get the name of the file to preview. Your widget may not be able to preview all kinds of files; your callback must call gtk-file-chooser-set-preview-widget-active to inform the file chooser about whether the preview was generated successfully or not.

Please see the example code in *(the missing figure, gtkfilechooser-preview.*

**file-activated**  
[Signal on <gtk-file-chooser>]

This signal is emitted when the user "activates" a file in the file chooser. This can happen by double-clicking on a file in the file list, or by pressing (keycap "Enter") . Normally you do not need to connect to this signal. It is used internally by <gtk-file-chooser-dialog> to know when to activate the default button in the dialog.

**confirm-overwrite**  
⇒ <gtk-file-chooser-confirmation>

This signal gets emitted whenever it is appropriate to present a confirmation dialog when the user has selected a file name that already exists. The signal only gets emitted when the file chooser is in <gtk-file-chooser-action-save> mode.

Most applications just need to turn on the do-overwrite-confirmation property (or call the gtk-file-chooser-set-do-overwrite-confirmation function), and they will automatically get a stock confirmation dialog. Applications which need to customize this behavior should do that, and also connect to the confirm-overwrite signal.

A signal handler for this signal must return a <gtk-file-chooser-confirmation> value, which indicates the action to take. If the handler determines that the user wants to select a different filename, it should return <gtk-file-chooser-confirmation-select-again>. If it determines that the user is satisfied with his choice of file
name, it should return `<gtk-file-chooser-confirmation-accept-filename>`. On the other hand, if it determines that the stock confirmation dialog should be used, it should return `<gtk-file-chooser-confirmation-confirm>`. The following example illustrates this.

**gtk-file-chooser-set-action** *(self <gtk-file-chooser>)*  
* (action <gtk-file-chooser-action>)*

**set-action**  
Sets the type of operation that the chooser is performing; the user interface is adapted to suit the selected action. For example, an option to create a new folder might be shown if the action is ‘GTK_FILE_CHOOSER_ACTION_SAVE’ but not if the action is ‘GTK_FILE_CHOOSER_ACTION_OPEN’.

`chooser` a <gtk-file-chooser>  
`action` the action that the file selector is performing

Since 2.4

**gtk-file-chooser-get-action** *(self <gtk-file-chooser>)*  
⇒ (ret <gtk-file-chooser-action>)*

**get-action**  
Gets the type of operation that the file chooser is performing; see **gtk-file-chooser-set-action**.

`chooser` a <gtk-file-chooser>  
`ret` the action that the file selector is performing

Since 2.4

**gtk-file-chooser-set-local-only** *(self <gtk-file-chooser>)*  
* (local-only bool)*

**set-local-only**  
Sets whether only local files can be selected in the file selector. If `local-only` is ‘#t’ (the default), then the selected file are files are guaranteed to be accessible through the operating systems native file file system and therefore the application only needs to worry about the filename functions in `<gtk-file-chooser>`, like `gtk-file-chooser-get-filename`, rather than the URI functions like `gtk-file-chooser-get-uri`,

`chooser` a <gtk-file-chooser>  
`local-only` ‘#t’ if only local files can be selected

Since 2.4

**gtk-file-chooser-get-local-only** *(self <gtk-file-chooser>)*  
⇒ (ret bool)*

**get-local-only**  
Gets whether only local files can be selected in the file selector. See **gtk-file-chooser-set-local-only**.

`chooser` a <gtk-file-chooser>  
`ret` ‘#t’ if only local files can be selected.

Since 2.4
gtk-file-chooser-set-show-hidden (self <gtk-file-chooser>) [Function]
(show_hidden bool)
set-show-hidden [Method]
Sets whether hidden files and folders are displayed in the file selector.

chooser a <gtk-file-chooser>
show-hidden ‘#t’ if hidden files and folders should be displayed.

Since 2.6

gtk-file-chooser-get-show-hidden (self <gtk-file-chooser>) [Function]
⇒ (ret bool)
get-show-hidden [Method]
Gets whether hidden files and folders are displayed in the file selector. See gtk-file-chooser-set-show-hidden.

chooser a <gtk-file-chooser>
ret ‘#t’ if hidden files and folders are displayed.

Since 2.6

gtk-file-chooser-set-current-name (self <gtk-file-chooser>) [Function]
(name mchars)
set-current-name [Method]
Sets the current name in the file selector, as if entered by the user. Note that the name passed in here is a UTF-8 string rather than a filename. This function is meant for such uses as a suggested name in a "Save As..." dialog.

If you want to preselect a particular existing file, you should use gtk-file-chooser-set-filename or gtk-file-chooser-set-uri instead. Please see the documentation for those functions for an example of using gtk-file-chooser-set-current-name as well.

chooser a <gtk-file-chooser>
name the filename to use, as a UTF-8 string

Since 2.4

gtk-file-chooser-get-filename (self <gtk-file-chooser>) [Function]
⇒ (ret mchars)
get-filename [Method]
Gets the filename for the currently selected file in the file selector. If multiple files are selected, one of the filenames will be returned at random.

If the file chooser is in folder mode, this function returns the selected folder.

chooser a <gtk-file-chooser>
ret The currently selected filename, or ‘#f’ if no file is selected, or the selected file can’t be represented with a local filename. Free with g-free.

Since 2.4
### Chapter 81: GtkFileChooser

#### gtk-file-chooser-set-filename

**Function**

```c
(gtk-file-chooser) (filename mchars) ⇒ (ret bool)
```

**set-filename**

Sets `filename` as the current filename for the file chooser, by changing to the file’s parent folder and actually selecting the file in list. If the `chooser` is in `<gtk-file-chooser-action-save>` mode, the file’s base name will also appear in the dialog’s file name entry.

If the file name isn’t in the current folder of `chooser`, then the current folder of `chooser` will be changed to the folder containing `filename`. This is equivalent to a sequence of `gtk-file-chooser-unselect-all` followed by `gtk-file-chooser-select-filename`.

Note that the file must exist, or nothing will be done except for the directory change.

If you are implementing a use this function if you already have a file name to which the user may save; for example, when the user opens an existing file and then does "File/Save As..." on it. If you don’t have a file name already &x2014; for example, if the user just created a new file and is saving it for the first time, do not call this function. Instead, use something similar to this:

```c
if (document_is_new)
{
    /* the user just created a new document */
    gtk_file_chooser_set_current_folder (chooser, default_folder_for_saving);
    gtk_file_chooser_set_current_name (chooser, "Untitled document");
}
else
{
    /* the user edited an existing document */
    gtk_file_chooser_set_filename (chooser, existing_filename);
}
```

`chooser` a `<gtk-file-chooser>`

`filename` the filename to set as current

`ret` ‘#t’ if both the folder could be changed and the file was selected successfully, ‘#f’ otherwise.

Since 2.4

#### gtk-file-chooser-select-filename

**Function**

```c
(gtk-file-chooser) (filename mchars) ⇒ (ret bool)
```

**select-filename**

Selects a filename. If the file name isn’t in the current folder of `chooser`, then the current folder of `chooser` will be changed to the folder containing `filename`.

`chooser` a `<gtk-file-chooser>`

`filename` the filename to select

`ret` ‘#t’ if both the folder could be changed and the file was selected successfully, ‘#f’ otherwise.
Since 2.4

\textbf{gtk-file-chooser-unselect-filename} \((self <\text{gtk-file-chooser}>)\)  
\small{(filename mchars)}  
\textbf{unselect-filename} \[\text{Method}\]  
Unselects a currently selected filename. If the filename is not in the current directory, does not exist, or is otherwise not currently selected, does nothing.

\textit{chooser} \quad a <\text{gtk-file-chooser}>
\textit{filename} \quad the filename to unselect

Since 2.4

\textbf{gtk-file-chooser-select-all} \((self <\text{gtk-file-chooser}>)\)  
\textbf{select-all} \[\text{Method}\]  
Selects all the files in the current folder of a file chooser.

\textit{chooser} \quad a <\text{gtk-file-chooser}>

Since 2.4

\textbf{gtk-file-chooser-unselect-all} \((self <\text{gtk-file-chooser}>)\)  
\textbf{unselect-all} \[\text{Method}\]  
Unselects all the files in the current folder of a file chooser.

\textit{chooser} \quad a <\text{gtk-file-chooser}>

Since 2.4

\textbf{gtk-file-chooser-get-filenames} \((self <\text{gtk-file-chooser}>)\)  
\[\Rightarrow (ret ~\text{gslist-of})\]  
\textbf{get-filenames} \[\text{Method}\]  
Lists all the selected files and subfolders in the current folder of \textit{chooser}. The returned names are full absolute paths. If files in the current folder cannot be represented as local filenames they will be ignored. (See \textit{gtk-file-chooser-get-uris})

\textit{chooser} \quad a <\text{gtk-file-chooser}>
\textit{ret} \quad a <\text{gs-list}> containing the filenames of all selected files and subfolders in the current folder. Free the returned list with \textit{g-slist-free}, and the filenames with \textit{g-free}.

Since 2.4

\textbf{gtk-file-chooser-set-current-folder} \((self <\text{gtk-file-chooser}>)\)  
\[\text{(filename mchars)} \Rightarrow (ret ~\text{bool})\]  
\textbf{set-current-folder} \[\text{Method}\]  
Sets the current folder for \textit{chooser} from a local filename. The user will be shown the full contents of the current folder, plus user interface elements for navigating to other folders.

\textit{chooser} \quad a <\text{gtk-file-chooser}>
\textit{filename} \quad the full path of the new current folder
Chapter 81: GtkFileChooser

ret ‘#t’ if the folder could be changed successfully, ‘#f’ otherwise.

Since 2.4

gtk-file-chooser-get-current-folder (self <gtk-file-chooser>) [Function]
⇒ (ret mchars)
get-current-folder [Method]
Gets the current folder of chooser as a local filename. See gtk-file-chooser-set-current-folder.

Note that this is the folder that the file chooser is currently displaying (e.g. "~/home/username/Documents"), which is not the same as the currently-selected folder if the chooser is in <gtk-file-chooser-select-folder> mode (e.g. "~/home/username/Documents/selected-folder/"). To get the currently-selected folder in that mode, use gtk-file-chooser-get-uri as the usual way to get the selection.

chooser a <gtk-file-chooser>
ret the full path of the current folder, or ‘#f’ if the current path cannot be represented as a local filename. Free with g-free. This function will also return ‘#f’ if the file chooser was unable to load the last folder that was requested from it; for example, as would be for calling gtk-file-chooser-set-current-folder on a nonexistent folder.

Since 2.4

gtk-file-chooser-get-uri (self <gtk-file-chooser>) [Function]
⇒ (ret mchars)
get-uri [Method]
Gets the URI for the currently selected file in the file selector. If multiple files are selected, one of the filenames will be returned at random.

If the file chooser is in folder mode, this function returns the selected folder.

chooser a <gtk-file-chooser>
ret The currently selected URI, or ‘#f’ if no file is selected. Free with g-free

Since 2.4

gtk-file-chooser-set-uri (self <gtk-file-chooser>) (uri mchars) [Function]
⇒ (ret bool)
set-uri [Method]
Sets the file referred to by uri as the current file for the file chooser, by changing to the URI’s parent folder and actually selecting the URI in the list. If the chooser is <gtk-file-chooser-action-save> mode, the URI’s base name will also appear in the dialog’s file name entry.

If the URI isn’t in the current folder of chooser, then the current folder of chooser will be changed to the folder containing uri. This is equivalent to a sequence of gtk-file-chooser-unselect-all followed by gtk-file-chooser-select-uri.

Note that the URI must exist, or nothing will be done except for the directory change.

If you are implementing a should use this function if you already have a file name to which the user may save; for example, when the user opens an existing file and then
does (guimenuitem "File/Save As...") on it. If you don’t have a file name already &amp;#x2014; for example, if the user just created a new file and is saving it for the first time, do not call this function. Instead, use something similar to this:

```c
if (document_is_new)
{
    /* the user just created a new document */
    gtk_file_chooser_set_current_folder_uri (chooser, default_folder_for_saving);
    gtk_file_chooser_set_current_name (chooser, "Untitled document");
}
else
{
    /* the user edited an existing document */
    gtk_file_chooser_set_uri (chooser, existing_uri);
}
```

`chooser` a `<gtk-file-chooser>`

`uri` the URI to set as current

`ret` ‘#t’ if both the folder could be changed and the URI was selected successfully, ‘#f’ otherwise.

Since 2.4

```c
gtk-file-chooser-select-uri (self <gtk-file-chooser>)  [Function]
(uri mchars) ⇒ (ret bool)
```

`select-uri` [Method]

Selects the file to by `uri`. If the URI doesn’t refer to a file in the current folder of `chooser`, then the current folder of `chooser` will be changed to the folder containing `filename`.

`chooser` a `<gtk-file-chooser>`

`uri` the URI to select

`ret` ‘#t’ if both the folder could be changed and the URI was selected successfully, ‘#f’ otherwise.

Since 2.4

```c
gtk-file-chooser-unselect-uri (self <gtk-file-chooser>)  [Function]
(uri mchars)
```

`unselect-uri` [Method]

Unselects the file referred to by `uri`. If the file is not in the current directory, does not exist, or is otherwise not currently selected, does nothing.

`chooser` a `<gtk-file-chooser>`

`uri` the URI to unselect

Since 2.4
Chapter 81: GtkFileChooser

gtk-file-chooser-get-uris (self <gtk-file-chooser>) ⇒ (ret gslist-of)

get-uris

Lists all the selected files and subfolders in the current folder of chooser. The returned names are full absolute URIs.

chooser a <gtk-file-chooser>

ret a <gs-list> containing the URIs of all selected files and subfolders in the current folder. Free the returned list with g-slist-free, and the filenames with g-free.

Since 2.4

gtk-file-chooser-set-preview-widget (self <gtk-file-chooser>) (preview_widget <gtk-widget>)

set-preview-widget

Sets an application-supplied widget to use to display a custom preview of the currently selected file. To implement a preview, after setting the preview widget, you connect to the ::update-preview signal, and call gtk-file-chooser-get-preview-filename or gtk-file-chooser-get-preview-uri on each change. If you can display a preview of the new file, update your widget and set the preview active using gtk-file-chooser-set-preview-widget-active. Otherwise, set the preview inactive.

When there is no application-supplied preview widget, or the application-supplied preview widget is not active, the file chooser may display an internally generated preview of the current file or it may display no preview at all.

chooser a <gtk-file-chooser>

preview-widget

widget for displaying preview.

Since 2.4

gtk-file-chooser-get-preview-widget (self <gtk-file-chooser>) ⇒ (ret <gtk-widget>)

get-preview-widget

Gets the current preview widget; see gtk-file-chooser-set-preview-widget.

chooser a <gtk-file-chooser>

ret the current preview widget, or ‘#f’

Since 2.4

gtk-file-chooser-get-preview-uri (self <gtk-file-chooser>) ⇒ (ret mchars)

get-preview-uri

Gets the URI that should be previewed in a custom preview widget. See gtk-filechooser-set-preview-widget.

chooser a <gtk-file-chooser>
the URI for the file to preview, or ‘#f’ if no file is selected. Free with g-free.

Since 2.4

gtk-file-chooser-set-extra-widget (self <gtk-file-chooser>)(extra_widget <gtk-widget>)
[Function]
set-extra-widget [Method]
Sets an application-supplied widget to provide extra options to the user.

chooser a <gtk-file-chooser>
extra-widget

Sets an application-supplied widget for extra options.

Since 2.4

gtk-file-chooser-get-extra-widget (self <gtk-file-chooser>)⇒ (ret <gtk-widget>)
get-extra-widget [Method]
Gets the current preview widget; see gtk-file-chooser-set-extra-widget.

chooser a <gtk-file-chooser>
ret

the current extra widget, or ‘#f’

Since 2.4

add-filter [Method]
Adds filter to the list of filters that the user can select between. When a filter is selected, only files that are passed by that filter are displayed.

Note that the chooser takes ownership of the filter, so you have to ref and sink it if you want to keep a reference.

chooser a <gtk-file-chooser>
filter a <gtk-file-filter>

Since 2.4

gtk-file-chooser-remove-filter (self <gtk-file-chooser>)(filter <gtk-file-filter>)
remove-filter [Method]
Removes filter from the list of filters that the user can select between.

chooser a <gtk-file-chooser>
filter a <gtk-file-filter>

Since 2.4
Chapter 81: GtkFileChooser

gtk-file-chooser-list-filters (self <gtk-file-chooser>)  [Function]
⇒ (ret gslist-of)
list-filters  [Method]
Lists the current set of user-selectable filters; see gtk-file-chooser-add-filter,
gtk-file-chooser-remove-filter.

Have  a  <gtk-file-chooser>
ret  a  <gs-list> containing the current set of user selectable filters. The
contents of the list are owned by GTK+, but you must free the list itself
with g-slist-free when you are done with it.
Since 2.4

gtk-file-chooser-set-filter (self <gtk-file-chooser>)  [Function]
(set-filter <gtk-file-filter>)
set-filter  [Method]
Sets the current filter; only the files that pass the filter will be displayed. If the
user-selectable list of filters is non-empty, then the filter should be one of the filters
in that list. Setting the current filter when the list of filters is empty is useful if you
want to restrict the displayed set of files without letting the user change it.

Have  a  <gtk-file-chooser>
filter  a  <gtk-file-filter>
Since 2.4

gtk-file-chooser-get-filter (self <gtk-file-chooser>)  [Function]
⇒ (ret <gtk-file-filter>)
get-filter  [Method]
Gets the current filter; see gtk-file-chooser-set-filter.

Have  a  <gtk-file-chooser>
ret  the current filter, or ‘#f’
Since 2.4
82 GtkFileChooserButton

A button to launch a file selection dialog

82.1 Overview

The `<gtk-file-chooser-button>` is a widget that lets the user select a file. It implements the `<gtk-file-chooser>` interface. Visually, it is a file name with a button to bring up a `<gtk-file-chooser-dialog>`. The user can then use that dialog to change the file associated with that button. This widget does not support setting the "select-multiple" property to '#t'.

```c
{
  GtkWidget *button;

  button = gtk_file_chooser_button_new (_("Select a file"),
    GTK_FILE_CHOOSER_ACTION_OPEN);
  gtk_file_chooser_set_current_folder (GTK_FILE_CHOOSER (button),
    "/etc");
}
```

The `<gtk-file-chooser-button>` supports the `<gtk-file-chooser-action>`s 'GTK_FILE_CHOOSER_ACTION_OPEN' and 'GTK_FILE_CHOOSER_ACTION_SELECT_FOLDER'.

The `<gtk-file-chooser-button>` will ellipse the label, and thus will thus request little horizontal space. To give the button more space, you should call `gtk-widget-size-request`, `gtk-file-chooser-button-set-width-chars`, or pack the button in such a way that other interface elements give space to the widget.

82.2 Usage

`<gtk-file-chooser-button>` [Class]

Derives from `<gtk-file-chooser>`, `<gtk-hbox>`. This class defines the following slots:

- **dialog** The file chooser dialog to use.
- **focus-on-click** Whether the button grabs focus when it is clicked with the mouse.
- **title** The title of the file chooser dialog.
- **width-chars** The desired width of the button widget, in characters.

`file-set` [Signal on `<gtk-file-chooser-button>`] undocumented

`gtk-file-chooser-button-new (title mchars)` [Function]

`(action <gtk-file-chooser-action>) ⇒ (ret <gtk-widget>)`

Creates a new file-selecting button widget.
**title** the title of the browse dialog.

**action** the open mode for the widget.

**ret** a new button widget.

Since 2.6

`gtk-file-chooser-button-get-title` [Function]

```
(self <gtk-file-chooser-button>) ⇒ (ret mchars)
```

**get-title** [Method]

Retrieves the title of the browse dialog used by `button`. The returned value should not be modified or freed.

**button** the button widget to examine.

**ret** a pointer to the browse dialog’s title.

Since 2.6

`gtk-file-chooser-button-set-title` [Function]

```
(self <gtk-file-chooser-button>) (title mchars)
```

**set-title** [Method]

Modifies the `title` of the browse dialog used by `button`.

**button** the button widget to modify.

**title** the new browse dialog title.

Since 2.6
83 GtkFileChooserDialog

A file chooser dialog, suitable for "File/Open" or "File/Save" commands

83.1 Overview

<gtk-file-chooser-dialog> is a dialog box suitable for use with "File/Open" or "File/Save as" commands. This widget works by putting a <gtk-file-chooser-widget> inside a <gtk-dialog>. It exposes the <gtk-file-chooser-iface> interface, so you can use all of the <gtk-file-chooser> functions on the file chooser dialog as well as those for <gtk-dialog>.

Note that <gtk-file-chooser-dialog> does not have any methods of its own. Instead, you should use the functions that work on a <gtk-file-chooser>.

In the simplest of cases, you can the following code to use <gtk-file-chooser-dialog> to select a file for opening:

```c
GtkWidget *dialog;

dialog = gtk_file_chooser_dialog_new ("Open File",
    parent_window,
    GTK_FILE_CHOOSER_ACTION_OPEN,
    GTK_STOCK_CANCEL, GTK_RESPONSE_CANCEL,
    GTK_STOCK_OPEN, GTK_RESPONSE_ACCEPT,
    NULL);

if (gtk_dialog_run (GTK_DIALOG (dialog)) == GTK_RESPONSE_ACCEPT)
{
    char *filename;

    filename = gtk_file_chooser_get_filename (GTK_FILE_CHOOSER (dialog));
    open_file (filename);
    g_free (filename);
}

gtk_widget_destroy (dialog);
```

To use a dialog for saving, you can use this:

```c
GtkWidget *dialog;

dialog = gtk_file_chooser_dialog_new ("Save File",
    parent_window,
    GTK_FILE_CHOOSER_ACTION_SAVE,
    GTK_STOCK_CANCEL, GTK_RESPONSE_CANCEL,
    GTK_STOCK_SAVE, GTK_RESPONSE_ACCEPT,
    NULL);
```
gtk_file_chooser_set_do_overwrite_confirmation (GTK_FILE_CHOOSER (dialog), TRUE);

if (user_edited_a_new_document)
{
    gtk_file_chooser_set_current_folder (GTK_FILE_CHOOSER (dialog), default_folder_for_saving);
    gtk_file_chooser_set_current_name (GTK_FILE_CHOOSER (dialog), "Untitled document")
}
else
    gtk_file_chooser_set_filename (GTK_FILE_CHOOSER (dialog), filename_for_existing_document);

if (gtk_dialog_run (GTK_DIALOG (dialog)) == GTK_RESPONSE_ACCEPT)
{
    char *filename;

    filename = gtk_file_chooser_get_filename (GTK_FILE_CHOOSER (dialog));
    save_to_file (filename);
    g_free (filename);
}

gtk_widget_destroy (dialog);

<gtk-file-chooser-dialog> inherits from <gtk-dialog>, so buttons that go in its action area have response codes such as <gtk-response-accept> and <gtk-response-cancel>. For example, you could call gtk-file-chooser-dialog-new as follows:

GtkWidget *dialog;

dialog = gtk_file_chooser_dialog_new ("Open File",
parent_window,
GTK_FILE_CHOOSER_ACTION_OPEN,
GTK_STOCK_CANCEL, GTK_RESPONSE_CANCEL,
GTK_STOCK_OPEN, GTK_RESPONSE_ACCEPT,
NULL);

This will create buttons for "Cancel" and "Open" that use stock response identifiers from <gtk-response-type>. For most dialog boxes you can use your own custom response codes rather than the ones in <gtk-response-type>, but <gtk-file-chooser-dialog> assumes that its "accept"-type action, e.g. an "Open" or "Save" button, will have one of the following response codes:

This is because <gtk-file-chooser-dialog> must intercept responses and switch to folders if appropriate, rather than letting the dialog terminate &amp;#x2014; the implementation uses these known response codes to know which responses can be blocked if appropriate.

To summarize, make sure you use a stock response code when you use <gtk-file-chooser-dialog> to ensure proper operation.
83.2 Usage

<gtk-file-chooser-dialog> [Class]
    Derives from <gtk-file-chooser>, <gtk-dialog>.
    This class defines no direct slots.
84 GtkFileChooserWidget

File chooser widget that can be embedded in other widgets

84.1 Overview

<gtk-file-chooser-widget> is a widget suitable for selecting files. It is the main building block of a <gtk-file-chooser-dialog>. Most applications will only need to use the latter; you can use <gtk-file-chooser-widget> as part of a larger window if you have special needs.

Note that <gtk-file-chooser-widget> does not have any methods of its own. Instead, you should use the functions that work on a <gtk-file-chooser>.

84.2 Usage

<gtk-file-chooser-widget>  
[Class]  
Dervies from <gtk-file-chooser-embed>, <gtk-file-chooser>, <gtk-vbox>.  
This class defines no direct slots.

gtk-file-chooser-widget-new  
[Function]  
\( (\text{action} \ <\text{gtk-file-chooser-action}> \Rightarrow (\text{ret} \ <\text{gtk-widget}>)) \)  
Creates a new <gtk-file-chooser-widget>. This is a file chooser widget that can be embedded in custom windows, and it is the same widget that is used by <gtk-file-chooser-dialog>.

\( \text{action} \quad \text{Open or save mode for the widget} \)  
\( \text{ret} \quad \text{a new <gtk-file-chooser-widget>} \)  

Since 2.4
85 GtkFileFilter

A filter for selecting a file subset

85.1 Overview

A GtkFileFilter can be used to restrict the files being shown in a `<gtk-file-chooser>`. Files can be filtered based on their name (with `gtk-file-filter-add-pattern`), on their mime type (with `gtk-file-filter-add-mime-type`), or by a custom filter function (with `gtk-file-filter-add-custom`).

Filtering by mime types handles aliasing and subclassing of mime types; e.g. a filter for text/plain also matches a file with mime type application/rtf, since application/rtf is a subclass of text/plain. Note that `<gtk-file-filter>` allows wildcards for the subtype of a mime type, so you can e.g. filter for image/*.

Normally, filters are used by adding them to a `<gtk-file-chooser>`, see `gtk-file-chooser-add-filter`, but it is also possible to manually use a filter on a file with `gtk-file-filter-filter`.

85.2 Usage

```c
<gtk-file-filter>

Derives from `<gtk-object>`.
This class defines no direct slots.
```

```c
gtk-file-filter-new ⇒ (ret <gtk-file-filter>)

Creates a new `<gtk-file-filter>` with no rules added to it. Such a filter doesn't accept any files, so is not particularly useful until you add rules with `gtk-file-filter-add-mime-type`, `gtk-file-filter-add-pattern`, or `gtk-file-filter-add-custom`. To create a filter that accepts any file, use:

```c
GtkFileFilter *filter = gtk_file_filter_new ();
gtk_file_filter_add_pattern (filter, "*");
```

`ret` a new `<gtk-file-filter>`

Since 2.4

```c
gtk-file-filter-set-name (self <gtk-file-filter>)
(set-name mchars)
```

Sets the human-readable name of the filter; this is the string that will be displayed in the file selector user interface if there is a selectable list of filters.

```c
filter a `<gtk-file-filter>`
name the human-readable-name for the filter, or ‘#f’ to remove any existing name.
```

Since 2.4
Chapter 85: GtkFileFilter

`gtk-file-filter-get-name (self <gtk-file-filter>)`  
⇒ (ret mchars)

get-name
Gets the human-readable name for the filter. See `gtk-file-filter-set-name`.

filter a <gtk-file-filter>
ret The human-readable name of the filter, or ‘#f’. This value is owned by GTK+ and must not be modified or freed.

Since 2.4

`gtk-file-filter-add-mime-type (self <gtk-file-filter>)`  
(mime_type mchars)

add-mime-type
Adds a rule allowing a given mime type to filter.

filter A <gtk-file-filter>
mime-type name of a MIME type

Since 2.4

`gtk-file-filter-add-pattern (self <gtk-file-filter>)`  
(pattern mchars)

add-pattern
Adds a rule allowing a shell style glob to a filter.

filter a <gtk-file-filter>
pattern a shell style glob

Since 2.4

`gtk-file-filter-add-pixbuf-formats (self <gtk-file-filter>)`  

add-pixbuf-formats
Adds a rule allowing image files in the formats supported by GdkPixbuf.

filter a <gtk-file-filter>

Since 2.6

`gtk-file-filter-get-needed (self <gtk-file-filter>)`  
⇒ (ret <gtk-file-filter-flags>)

get-needed
Gets the fields that need to be filled in for the structure passed to `gtk-file-filter-filter`

This function will not typically be used by applications; it is intended principally for use in the implementation of `<gtk-file-chooser>`.

filter a <gtk-file-filter>
ret bitfield of flags indicating needed fields when calling `gtk-file-filter-filter`

Since 2.4
86 GtkFontButton

A button to launch a font selection dialog

86.1 Overview

The <gtk-font-button> is a button which displays the currently selected font and allows to open a font selection dialog to change the font. It is a suitable widget for selecting a font in a preference dialog.

86.2 Usage

<gtk-font-button>  [Class]

Derives from <gtk-button>.

This class defines the following slots:

- **title**  The title of the font selection dialog
- **font-name**  The name of the selected font
- **use-font**  Whether the label is drawn in the selected font
- **use-size**  Whether the label is drawn with the selected font size
- **show-style**  Whether the selected font style is shown in the label
- **show-size**  Whether selected font size is shown in the label

font-set  [Signal on <gtk-font-button>]

The ::font-set signal is emitted when the user selects a font. When handling this signal, use gtk-font-button-get-font-name to find out which font was just selected.

Note that this signal is only emitted when the user changes the font. If you need to react to programmatic font changes as well, use the notify::font-name signal.

Since 2.4

gtk-font-button-new ⇒ (ret <gtk-widget>)  [Function]

Creates a new font picker widget.

ret  a new font picker widget.

Since 2.4

gtk-font-button-new-with-font (fontname mchars) ⇒ (ret <gtk-widget>)  [Function]

Creates a new font picker widget.

fontname  Name of font to display in font selection dialog

ret  a new font picker widget.

Since 2.4
Chapter 86: GtkFontButton

**gtk-font-button-set-font-name** (*self* <gtk-font-button>) [Function]

    (fontname mchars) ⇒ (ret bool)

*set-font-name* [Method]

Sets or updates the currently-displayed font in font picker dialog.

*font-button*  
a <gtk-font-button>

*fontname* Name of font to display in font selection dialog

*ret* Return value of gtk-font-selection-dialog-set-font-name if the font selection dialog exists, otherwise ‘#f’.

Since 2.4

**gtk-font-button-get-font-name** (*self* <gtk-font-button>) [Function]

    ⇒ (ret mchars)

*get-font-name* [Method]

Retrieves the name of the currently selected font.

*font-button*  
a <gtk-font-button>

*ret* an internal copy of the font name which must not be freed.

Since 2.4

**gtk-font-button-set-show-style** (*self* <gtk-font-button>) [Function]

    (show_style bool)

*set-show-style* [Method]

If *show-style* is ‘#t’, the font style will be displayed along with name of the selected font.

*font-button*  
a <gtk-font-button>

*show-style* ‘#t’ if font style should be displayed in label.

Since 2.4

**gtk-font-button-get-show-style** (*self* <gtk-font-button>) [Function]

    ⇒ (ret bool)

*get-show-style* [Method]

Returns whether the name of the font style will be shown in the label.

*font-button*  
a <gtk-font-button>

*ret* whether the font style will be shown in the label.

Since 2.4

**gtk-font-button-set-show-size** (*self* <gtk-font-button>) [Function]

    (show_size bool)

*set-show-size* [Method]

If *show-size* is ‘#t’, the font size will be displayed along with the name of the selected font.
font-button
  a <gtk-font-button>

show-size ‘#t’ if font size should be displayed in dialog.

Since 2.4

gtk-font-button-get-show-size (self <gtk-font-button>) [Function]
  ⇒ (ret bool)
get-show-size
  Returns whether the font size will be shown in the label.

font-button
  a <gtk-font-button>
  ret whether the font size will be shown in the label.

Since 2.4

gtk-font-button-set-use-font (self <gtk-font-button>) [Function]
  (use_font bool)
set-use-font
  If use-font is ‘#t’, the font name will be written using the selected font.

font-button
  a <gtk-font-button>
  use-font If ‘#t’, font name will be written using font chosen.

Since 2.4

gtk-font-button-get-use-font (self <gtk-font-button>) [Function]
  ⇒ (ret bool)
get-use-font
  Returns whether the selected font is used in the label.

font-button
  a <gtk-font-button>
  ret whether the selected font is used in the label.

Since 2.4

gtk-font-button-set-use-size (self <gtk-font-button>) [Function]
  (use_size bool)
set-use-size
  If use-size is ‘#t’, the font name will be written using the selected size.

font-button
  a <gtk-font-button>
  use-size If ‘#t’, font name will be written using the selected size.

Since 2.4
gtk-font-button-get-use-size (self <gtk-font-button>) ⇒ (ret bool)

get-use-size
Returns whether the selected size is used in the label.

font-button
  a <gtk-font-button>
ret
whether the selected size is used in the label.

Since 2.4

gtk-font-button-set-title (self <gtk-font-button>)
(set-title mchars)

set-title
Sets the title for the font selection dialog.

font-button
  a <gtk-font-button>
title
  a string containing the font selection dialog title

Since 2.4

gtk-font-button-get-title (self <gtk-font-button>) ⇒ (ret mchars)

get-title
Retrieves the title of the font selection dialog.

font-button
  a <gtk-font-button>
ret
an internal copy of the title string which must not be freed.

Since 2.4
Chapter 87: GtkFontSelection

87 GtkFontSelection

A widget for selecting fonts

87.1 Overview

The `<gtk-font-selection>` widget lists the available fonts, styles and sizes, allowing the user to select a font. It is used in the `<gtk-font-selection-dialog>` widget to provide a dialog box for selecting fonts.

To set the font which is initially selected, use `gtk-font-selection-set-font-name`. To get the selected font use `gtk-font-selection-get-font-name`. To change the text which is shown in the preview area, use `gtk-font-selection-set-preview-text`.

87.2 Usage

`<gtk-font-selection>`

Derives from `<gtk-vbox>`.

This class defines the following slots:

- `font-name`:
  The X string that represents this font
- `font`:
  The GdkFont that is currently selected
- `preview-text`:
  The text to display in order to demonstrate the selected font

`gtk-font-selection-new` ⇒ (ret `<gtk-widget>`) [Function]

`gtk-font-selection-get-font-name (self `<gtk-font-selection>`)` ⇒ (ret `mchars`) [Function]

`get-font-name` [Method]

Gets the currently-selected font name. Note that this can be a different string than what you set with `gtk-font-selection-set-font-name`, as the font selection widget may normalize font names and thus return a string with a different structure. For example, "Helvetica Italic Bold 12" could be normalized to "Helvetica Bold Italic 12". Use `pango-font-description-equal` if you want to compare two font descriptions.

`fontsels` a `<gtk-font-selection>`

`ret` A string with the name of the current font, or `#f` if no font is selected. You must free this string with `g-free`.

`gtk-font-selection-set-font-name (self `<gtk-font-selection>`)` ⇒ (ret `bool`) [Function]

`set-font-name` [Method]

Sets the currently-selected font. Note that the `fontsels` needs to know the screen in which it will appear for this to work; this can be guaranteed by simply making sure that the `fontsels` is inserted in a toplevel window before you call this function.
fontsel  a <gtk-font-selection>
fontname a font name like "Helvetica 12" or "Times Bold 18"
ret      #t if the font could be set successfully; #f if no such font exists or if the
         fontsel doesn’t belong to a particular screen yet.

gtk-font-selection-get-preview-text  [Function]
         (self <gtk-font-selection>) ⇒ (ret mchars)
get-preview-text          [Method]
         Gets the text displayed in the preview area.
         fontsel  a <gtk-font-selection>.
         ret      the text displayed in the preview area. This string is owned by the widget
         and should not be modified or freed.

gtk-font-selection-set-preview-text  [Function]
         (self <gtk-font-selection>) (text mchars)
set-preview-text          [Method]
         Sets the text displayed in the preview area.
         fontsel  a <gtk-font-selection>.
         text     the text to display in the preview area.
88 GtkFontSelectionDialog

A dialog box for selecting fonts

88.1 Overview

The `<gtk-font-selection-dialog>` widget is a dialog box for selecting a font.

To set the font which is initially selected, use `gtk-font-selection-dialog-set-font-name`.

To get the selected font use `gtk-font-selection-dialog-get-font-name`.

To change the text which is shown in the preview area, use `gtk-font-selection-dialog-set-preview-text`.

88.2 Usage

`<gtk-font-selection-dialog>`

Derives from `<gtk-dialog>`.

This class defines no direct slots.

`gtk-font-selection-dialog-new (title mchars)`

⇒ (ret `<gtk-widget>`)  

Creates a new `<gtk-font-selection-dialog>`.

`title` the title of the dialog box.

`ret` a new `<gtk-font-selection-dialog>`.
89 GtkInputDialog

Configure devices for the XInput extension

89.1 Overview

NOTE this widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

<gtk-input-dialog> displays a dialog which allows the user to configure XInput extension devices. For each device, they can control the mode of the device (disabled, screen-relative, or window-relative), the mapping of axes to coordinates, and the mapping of the devices macro keys to key press events.

<gtk-input-dialog> contains two buttons to which the application can connect; one for closing the dialog, and one for saving the changes. No actions are bound to these by default. The changes that the user makes take effect immediately.

89.2 Usage

<gtk-input-dialog> [Class]

Derives from <gtk-dialog>.

This class defines no direct slots.

enable-device (arg0 <gdk-device>) [Signal on <gtk-input-dialog>]

This signal is emitted when the user changes the mode of a device from <gdk-mode-disabled> to a <gdk-mode-screen> or <gdk-mode-window>.

disable-device (arg0 <gdk-device>) [Signal on <gtk-input-dialog>]

This signal is emitted when the user changes the mode of a device from a <gdk-mode-screen> or <gdk-mode-window> to <gdk-mode-enabled>.

gtk-input-dialog-new ⇒ (ret <gtk-widget>) [Function]

Creates a new <gtk-input-dialog>.

ret the new <gtk-input-dialog>.
90 GtkAlignment

A widget which controls the alignment and size of its child

90.1 Overview

The <gtk-alignment> widget controls the alignment and size of its child widget. It has four settings: xscale, yscale, xalign, and yalign.

The scale settings are used to specify how much the child widget should expand to fill the space allocated to the <gtk-alignment>. The values can range from 0 (meaning the child doesn’t expand at all) to 1 (meaning the child expands to fill all of the available space).

The align settings are used to place the child widget within the available area. The values range from 0 (top or left) to 1 (bottom or right). Of course, if the scale settings are both set to 1, the alignment settings have no effect.

90.2 Usage

<gtk-alignment> [Class]

Derives from <gtk-bin>.

This class defines the following slots:

- xalign: Horizontal position of child in available space. 0.0 is left aligned, 1.0 is right aligned
- yalign: Vertical position of child in available space. 0.0 is top aligned, 1.0 is bottom aligned
- xscale: If available horizontal space is bigger than needed for the child, how much of it to use for the child. 0.0 means none, 1.0 means all
- yscale: If available vertical space is bigger than needed for the child, how much of it to use for the child. 0.0 means none, 1.0 means all
- top-padding: The padding to insert at the top of the widget.
- bottom-padding: The padding to insert at the bottom of the widget.
- left-padding: The padding to insert at the left of the widget.
- right-padding: The padding to insert at the right of the widget.

gtk-alignment-new (xalign float) (yalign float) (xscale float) (yscale float) [Function]

Creates a new <gtk-alignment>.

xalign: the horizontal alignment of the child widget, from 0 (left) to 1 (right).

yalign: the vertical alignment of the child widget, from 0 (top) to 1 (bottom).
xscale the amount that the child widget expands horizontally to fill up unused space, from 0 to 1. A value of 0 indicates that the child widget should never expand. A value of 1 indicates that the child widget will expand to fill all of the space allocated for the `<gtk-alignment>`.

yscale the amount that the child widget expands vertically to fill up unused space, from 0 to 1. The values are similar to xscale.

ret the new `<gtk-alignment>`.

gtk-alignment-set (self `<gtk-alignment>`) (xalign float) (yalign float) (xscale float) (yscale float) [Function]

set Sets the `<gtk-alignment>` values.

alignment a `<gtk-alignment>`.

xalign the horizontal alignment of the child widget, from 0 (left) to 1 (right).

yalign the vertical alignment of the child widget, from 0 (top) to 1 (bottom).

xscale the amount that the child widget expands horizontally to fill up unused space, from 0 to 1. A value of 0 indicates that the child widget should never expand. A value of 1 indicates that the child widget will expand to fill all of the space allocated for the `<gtk-alignment>`.

yscale the amount that the child widget expands vertically to fill up unused space, from 0 to 1. The values are similar to xscale.

gtk-alignment-get-padding (self `<gtk-alignment>`) ⇒ (padding_top unsigned-int) (padding_bottom unsigned-int) (padding_left unsigned-int) (padding_right unsigned-int) [Function]

get-padding Gets the padding on the different sides of the widget. See gtk-alignment-set-padding.

alignment a `<gtk-alignment>`

padding-top location to store the padding for the top of the widget, or ‘#f’

padding-bottom location to store the padding for the bottom of the widget, or ‘#f’

padding-left location to store the padding for the left of the widget, or ‘#f’

padding-right location to store the padding for the right of the widget, or ‘#f’

Since 2.4
**gtk-alignment-set-padding** *(self <gtk-alignment>)*

*Function*

```
(padding_top unsigned-int) (padding_bottom unsigned-int)
(padding_left unsigned-int) (padding_right unsigned-int)
```

**set-padding**

*Method*

Sets the padding on the different sides of the widget. The padding adds blank space to the sides of the widget. For instance, this can be used to indent the child widget towards the right by adding padding on the left.

```
alignment  a <gtk-alignment>

padding-top
    the padding at the top of the widget

padding-bottom
    the padding at the bottom of the widget

padding-left
    the padding at the left of the widget

padding-right
    the padding at the right of the widget.
```

Since 2.4
91 GtkAspectFrame

A frame that constrains its child to a particular aspect ratio

91.1 Overview

The <gtk-aspect-frame> is useful when you want pack a widget so that it can resize but always retains the same aspect ratio. For instance, one might be drawing a small preview of a larger image. <gtk-aspect-frame> derives from <gtk-frame>, so it can draw a label and a frame around the child. The frame will be "shrink-wrapped" to the size of the child.

91.2 Usage

<gtk-aspect-frame>  
[Class]  
Derives from <gtk-frame>.  
This class defines the following slots:  
\begin{itemize}  
\item xalign X alignment of the child  
\item yalign Y alignment of the child  
\item ratio Aspect ratio if obey_child is FALSE  
\item obey-child Force aspect ratio to match that of the frame’s child  
\end{itemize}  

\texttt{gtk-aspect-frame-new (label mchars) (xalign float) (yalign float) (ratio float) (obey\_child bool)} \Rightarrow (ret <gtk-widget>)  
Create a new <gtk-aspect-frame>.  
\begin{itemize}  
\item label Label text.  
\item xalign Horizontal alignment of the child within the allocation of the <gtk-aspect-frame>. This ranges from 0.0 (left aligned) to 1.0 (right aligned)  
\item yalign Vertical alignment of the child within the allocation of the <gtk-aspect-frame>. This ranges from 0.0 (left aligned) to 1.0 (right aligned)  
\item ratio The desired aspect ratio.  
\item obey-child If ‘#t’, ratio is ignored, and the aspect ratio is taken from the requisition of the child.  
\item ret the new <gtk-aspect-frame>.  
\end{itemize}  

\texttt{gtk-aspect-frame-set (self <gtk-aspect-frame>) (xalign float) (yalign float) (ratio float) (obey\_child bool)}  
set  
Set parameters for an existing <gtk-aspect-frame>.  
\begin{itemize}  
\item aspect-frame a <gtk-aspect-frame>  
\item xalign Horizontal alignment of the child within the allocation of the <gtk-aspect-frame>. This ranges from 0.0 (left aligned) to 1.0 (right aligned)  
\end{itemize}
yalign  Vertical alignment of the child within the allocation of the <gtk-aspect-frame>. This ranges from 0.0 (left aligned) to 1.0 (right aligned)

t ratio  The desired aspect ratio.

obey-child  If ‘#t’, ratio is ignored, and the aspect ratio is taken from the requisition of the child.
92 GtkHBox

A horizontal container box

92.1 Overview

GtkHBox is a container that organizes child widgets into a single row.

Use the `<gtk-box>` packing interface to determine the arrangement, spacing, width, and alignment of GtkHBox children.

All children are allocated the same height.

92.2 Usage

`<gtk-hbox>`

Class

Derives from `<gtk-box>`.

This class defines no direct slots.

`gtk-hbox-new (homogeneous bool) (spacing int)`

Function

Gives a new GtkHBox.

`homogeneous`

‘#t’ if all children are to be given equal space allotments.

`spacing`

the number of pixels to place by default between children.

`ret`

a new GtkHBox.
Chapter 93: GtkVBox

93  GtkVBox

A vertical container box

93.1  Overview

GtkVBox is a container that organizes child widgets into a single column.

Use the `<gtk-box>` packing interface to determine the arrangement, spacing, height, and alignment of GtkVBox children.

All children are allocated the same width.

93.2  Usage

`<gtk-vbox>`  
    Derives from `<gtk-box>`.  
    This class defines no direct slots.

`gtk-vbox-new (homogeneous bool) (spacing int)`  
    ⇒ (ret `<gtk-widget>`)  
    Creates a new GtkVBox.

homogeneous
    ‘#t’ if all children are to be given equal space allotments.

spacing
    the number of pixels to place by default between children.

ret
    a new GtkVBox.
94 GtkHButtonBox

A container for arranging buttons horizontally

94.1 Overview

A button box should be used to provide a consistent layout of buttons throughout your application. The layout/spacing can be altered by the programmer, or if desired, by the user to alter the 'feel' of a program to a small degree.

A `<gtk-hbutton-box>` is created with `gtk-hbutton-box-new`. Buttons are packed into a button box the same way widgets are added to any other container, using `gtk-container-add`. You can also use `gtk-box-pack-start` or `gtk-box-pack-end`, but for button boxes both these functions work just like `gtk-container-add`, i.e., they pack the button in a way that depends on the current layout style and on whether the button has had `gtk-button-box-set-child-secondary` called on it.

The spacing between buttons can be set with `gtk-box-set-spacing`. The arrangement and layout of the buttons can be changed with `gtk-button-box-set-layout`.

94.2 Usage

`<gtk-hbutton-box>`

<table>
<thead>
<tr>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Derives from <code>&lt;gtk-button-box&gt;</code>.</td>
</tr>
<tr>
<td>This class defines no direct slots.</td>
</tr>
</tbody>
</table>

`gtk-hbutton-box-new ⇒ (ret `<gtk-widget>`)`

<table>
<thead>
<tr>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates a new horizontal button box.</td>
</tr>
<tr>
<td><code>ret</code> a new button box <code>&lt;gtk-widget&gt;</code>.</td>
</tr>
</tbody>
</table>
Chapter 95: GtkVButtonBox

95 GtkVButtonBox

A container for arranging buttons vertically

95.1 Overview

A button box should be used to provide a consistent layout of buttons throughout your application. The layout/spacing can be altered by the programmer, or if desired, by the user to alter the 'feel' of a program to a small degree.

A `<gtk-vbutton-box>` is created with `gtk-vbutton-box-new`. Buttons are packed into a button box the same way widgets are added to any other container, using `gtk-container-add`. You can also use `gtk-box-pack-start` or `gtk-box-pack-end`, but for button boxes both these functions work just like `gtk-container-add`, i.e., they pack the button in a way that depends on the current layout style and on whether the button has had `gtk-button-box-set-child-secondary` called on it.

The spacing between buttons can be set with `gtk-box-set-spacing`. The arrangement and layout of the buttons can be changed with `gtk-button-box-set-layout`.

95.2 Usage

```plaintext
<gtk-vbutton-box>  [Class]
    Derives from <gtk-button-box>.
    This class defines no direct slots.

gtk-vbutton-box-new ⇒ (ret <gtk-widget>)  [Function]
    Creates a new vertical button box.
    ret a new button box <gtk-widget>.
```
96 GtkFixed

A container which allows you to position widgets at fixed coordinates

96.1 Overview

The `<gtk-fixed>` widget is a container which can place child widgets at fixed positions and with fixed sizes, given in pixels. `<gtk-fixed>` performs no automatic layout management.

For most applications, you should not use this container! It keeps you from having to learn about the other GTK+ containers, but it results in broken applications. With `<gtk-fixed>`, the following things will result in truncated text, overlapping widgets, and other display bugs:

Themes, which may change widget sizes.

Fonts other than the one you used to write the app will of course change the size of widgets containing text; keep in mind that users may use a larger font because of difficulty reading the default, or they may be using Windows or the framebuffer port of GTK+, where different fonts are available.

Translation of text into other languages changes its size. Also, display of non-English text will use a different font in many cases.

In addition, the fixed widget can’t properly be mirrored in right-to-left languages such as Hebrew and Arabic. i.e. normally GTK+ will flip the interface to put labels to the right of the thing they label, but it can’t do that with `<gtk-fixed>`. So your application will not be usable in right-to-left languages.

Finally, fixed positioning makes it kind of annoying to add/remove GUI elements, since you have to reposition all the other elements. This is a long-term maintenance problem for your application.

If you know none of these things are an issue for your application, and prefer the simplicity of `<gtk-fixed>`, by all means use the widget. But you should be aware of the tradeoffs.

96.2 Usage

`<gtk-fixed>`

[Class]

Derives from `<gtk-container>`.

This class defines no direct slots.

gtk-fixed-new ⇒ (ret `<gtk-widget>`)  [Function]

Creates a new `<gtk-fixed>`.

`ret` a new `<gtk-fixed>`.

gtk-fixed-put (self `<gtk-fixed>`) (widget `<gtk-widget>`) (x int) (y int)  [Function]

`put` Adds a widget to a `<gtk-fixed>` container at the given position.

`fixed` a `<gtk-fixed>`.
widget the widget to add.
x the horizontal position to place the widget at.
y the vertical position to place the widget at.

**gtk-fixed-move** *(self <gtk-fixed>) (widget <gtk-widget>) (x int) (y int)*  

**Method**

Moves a child of a <gtk-fixed> container to the given position.

* fixed a <gtk-fixed>.
* widget the child widget.
* x the horizontal position to move the widget to.
* y the vertical position to move the widget to.

**gtk-fixed-get-has-window** *(self <gtk-fixed>) ⇒ (ret bool)*  

**Method**

Gets whether the <gtk-fixed> has its own <gdk-window>. See gdk-fixed-set-has-window.

* fixed a <gtk-widget>
* ret ‘#t’ if fixed has its own window.

**gtk-fixed-set-has-window** *(self <gtk-fixed>) (has_window bool)*  

**Method**

Sets whether a <gtk-fixed> widget is created with a separate <gdk-window> for widget->window or not. (By default, it will be created with no separate <gdk-window>). This function must be called while the <gtk-fixed> is not realized, for instance, immediately after the window is created.

This function was added to provide an easy migration path for older applications which may expect <gtk-fixed> to have a separate window.

* fixed a <gtk-fixed>
* has-window
  * ‘#t’ if a separate window should be created
Chapter 97: GtkHPaned

97 GtkHPaned

A container with two panes arranged horizontally

97.1 Overview

The HPaned widget is a container widget with two children arranged horizontally. The division between the two panes is adjustable by the user by dragging a handle. See `<gtk-paned>` for details.

97.2 Usage

```
<gtk-hpaned>  [Class]
    Derives from `<gtk-paned>`.
    This class defines no direct slots.

gtk-hpaned-new ⇒ (ret <gtk-widget>)  [Function]
    Create a new `<gtk-hpaned>`
    ret the new `<gtk-hpaned>`
```
98 GtkVPaned

A container with two panes arranged vertically

98.1 Overview

The VPaned widget is a container widget with two children arranged vertically. The division between the two panes is adjustable by the user by dragging a handle. See `<gtk-paned>` for details.

98.2 Usage

```
<gtk-vpaned>                     [Class]
   Derives from <gtk-paned>.
   This class defines no direct slots.

gtk-vpaned-new ⇒ (ret <gtk-widget>)  [Function]
   Create a new <gtk-vpaned>

ret the new <gtk-vpaned>
```
Chapter 99: GtkLayout

Infinite scrollable area containing child widgets and/or custom drawing

99.1 Overview

&lt;gtk-layout&gt; is similar to &lt;gtk-drawing-area&gt; in that it’s a "blank slate" and doesn’t do anything but paint a blank background by default. It’s different in that it supports scrolling natively (you can add it to a &lt;gtk-scrolled-window&gt;), and it can contain child widgets, since it’s a &lt;gtk-container&gt;. However if you’re just going to draw, a &lt;gtk-drawing-area&gt; is a better choice since it has lower overhead.

When handling expose events on a &lt;gtk-layout&gt;, you must draw to GTK_LAYOUT (layout)-&gt;bin_window, rather than to GTK_WIDGET (layout)-&gt;window, as you would for a drawing area.

99.2 Usage

&lt;gtk-layout&gt;  
[Class]

Derives from &lt;gtk-container&gt;.

This class defines the following slots:

hadjustment  
The GtkAdjustment for the horizontal position

vadjustment  
The GtkAdjustment for the vertical position

width  
The width of the layout

height  
The height of the layout

set-scroll-adjustments (arg0 &lt;gtk-adjustment&gt;)  
[Signal on &lt;gtk-layout&gt;]

(arg1 &lt;gtk-adjustment&gt;)

gtk-layout-new (hadjustment &lt;gtk-adjustment&gt;)  
[Function]

(vadjustment &lt;gtk-adjustment&gt;) ⇒ (ret &lt;gtk-widget&gt;)

Creates a new &lt;gtk-layout&gt;. Unless you have a specific adjustment you’d like the layout to use for scrolling, pass ‘#f’ for hadjustment and vadjustment.

hadjustment  
horizontal scroll adjustment, or ‘#f’

vadjustment  
vertical scroll adjustment, or ‘#f’

ret  
a new &lt;gtk-layout&gt;

gtk-layout-put (self &lt;gtk-layout&gt;) (child_widget &lt;gtk-widget&gt;)  
[Function]

(x int) (y int)

put  
Adds child-widget to layout, at position (x,y). layout becomes the new parent container of child-widget.
Chapter 99: GSKLayout

layout  a <gtk-layout>

child-widget
  child widget

x  X position of child widget

y  Y position of child widget

gtk-layout-move (self <gtk-layout>)(child_widget <gtk-widget>) (x int)(y int) [Function]

  move
  Moves a current child of layout to a new position.

layout  a <gtk-layout>

child-widget
  a current child of layout

x  X position to move to

y  Y position to move to

gtk-layout-set-size (self <gtk-layout>)(width unsigned-int) [Function]

  (height unsigned-int)

set-size [Method]

  Sets the size of the scrollable area of the layout.

layout  a <gtk-layout>

width  width of entire scrollable area

height  height of entire scrollable area

gtk-layout-get-size (self <gtk-layout>)⇒ (width unsigned-int) [Function]

  (height unsigned-int)

get-size [Method]

  Gets the size that has been set on the layout, and that determines the total extents of the layout’s scrollbar area. See gtk-layout-set-size.

layout  a <gtk-layout>

width  location to store the width set on layout, or ‘#f’

height  location to store the height set on layout, or ‘#f’

gtk-layout-get-hadjustment (self <gtk-layout>) ⇒ (ret <gtk-adjustment>) [Function]

get-hadjustment [Method]

  This function should only be called after the layout has been placed in a <gtk-scrolled-window> or otherwise configured for scrolling. It returns the <gtk-adjustment> used for communication between the horizontal scrollbar and layout.

  See <gtk-scrolled-window>, <gtk-scrollbar>, <gtk-adjustment> for details.

layout  a <gtk-layout>

ret  horizontal scroll adjustment
Chapter 99: GtkLayout

```python
gtk-layout-get-vadjustment (self <gtk-layout>)  ⇒ (ret <gtk-adjustment>)
```

**get-vadjustment**

This function should only be called after the layout has been placed in a `<gtk-scrolled-window>` or otherwise configured for scrolling. It returns the `<gtk-adjustment>` used for communication between the vertical scrollbar and layout.

See `<gtk-scrolled-window>`, `<gtk-scrollbar>`, `<gtk-adjustment>` for details.

```python
layout  a <gtk-layout>
ret     vertical scroll adjustment
```

```python
gtk-layout-set-hadjustment (self <gtk-layout>) (adjustment <gtk-adjustment>)
```

**set-hadjustment**

Sets the horizontal scroll adjustment for the layout.

See `<gtk-scrolled-window>`, `<gtk-scrollbar>`, `<gtk-adjustment>` for details.

```python
layout  a <gtk-layout>
adjustment  new scroll adjustment
```

```python
gtk-layout-set-vadjustment (self <gtk-layout>) (adjustment <gtk-adjustment>)
```

**set-vadjustment**

Sets the vertical scroll adjustment for the layout.

See `<gtk-scrolled-window>`, `<gtk-scrollbar>`, `<gtk-adjustment>` for details.

```python
layout  a <gtk-layout>
adjustment  new scroll adjustment
```
100 GtkNotebook

A tabbed notebook container

100.1 Overview

The `<gtk-notebook>` widget is a `<gtk-container>` whose children are pages that can be switched between using tab labels along one edge.

There are many configuration options for `<gtk-notebook>`. Among other things, you can choose on which edge the tabs appear (see `gtk-notebook-set-tab-pos`), whether, if there are too many tabs to fit the notebook should be made bigger or scrolling arrows added (see `gtk-notebook-set-scrolable`), and whether there will be a popup menu allowing the users to switch pages. (see `gtk-notebook-enable-popup`, `gtk-notebook-disable-popup`)

100.2 Usage

```
<gtk-notebook>
[Class]
```

Derives from `<gtk-container>`.

This class defines the following slots:

- `tab-pos` Which side of the notebook holds the tabs
- `show-tabs` Whether tabs should be shown or not
- `show-border` Whether the border should be shown or not
- `scrollable` If TRUE, scroll arrows are added if there are too many tabs to fit
- `tab-border` Width of the border around the tab labels
- `tab-hborder` Width of the horizontal border of tab labels
- `tab-vborder` Width of the vertical border of tab labels
- `page` The index of the current page
- `enable-popup` If TRUE, pressing the right mouse button on the notebook pops up a menu that you can use to go to a page
- `group-id` Group ID for tabs drag and drop
- `group` Group for tabs drag and drop
- `homogeneous` Whether tabs should have homogeneous sizes
Switch-page (arg0 <gpointer>) (arg1 <guint>) [Signal on <gtk-notebook>]
Emitted when the user or a function changes the current page.

Focus-tab (arg0 <gtk-notebook-tab>) ⇒ <gboolean>
Select-page (arg0 <gboolean>) ⇒ <gboolean>
Change-current-page (arg0 <gint>) ⇒ <gboolean>
Move-focus-out (arg0 <gtk-direction-type>) ⇒ <gboolean>
Reorder-tab (arg0 <gtk-direction-type>) (arg1 <gboolean>) ⇒ <gboolean>
Page-reordered (arg0 <gtk-widget>) (arg1 <guint>)
The ::page-reordered signal is emitted in the notebook right after a page has been reordered.
Since 2.10

Page-removed (arg0 <gtk-widget>) (arg1 <guint>) [Signal on <gtk-notebook>]
The ::page-removed signal is emitted in the notebook right after a page is removed from the notebook.
Since 2.10

Page-added (arg0 <gtk-widget>) (arg1 <guint>) [Signal on <gtk-notebook>]
The ::page-added signal is emitted in the notebook right after a page is added to the notebook.
Since 2.10

Create-window (arg0 <gtk-widget>) (arg1 <gint>) (arg2 <gint>) ⇒ <gpointer> [Function]

Gtk-notebook-new ⇒ (ret <gtk-notebook>)
Creates a new <gtk-notebook> widget with no pages.
Ret the newly created <gtk-notebook>

Gtk-notebook-append-page (self <gtk-notebook>) (child <gtk-widget>) (tab-label <gtk-widget>) ⇒ (ret int) [Function]
Append-page
Appends a page to notebook.
Notebook a <gtk-notebook>
Child the <gtk-widget> to use as the contents of the page.
Tab-label the <gtk-widget> to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
Ret the index (starting from 0) of the appended page in the notebook, or -1 if function fails
### Append Page Menu

**Function**

```python
gtk-notebook-append-page-menu (self <gtk-notebook>)
  (child <gtk-widget>) (tab_label <gtk-widget>)
  (menu_label <gtk-widget>) ⇒ (ret int)
```

**Method**

**append-page-menu**

Appends a page to `notebook`, specifying the widget to use as the label in the popup menu.

- **notebook** a `<gtk-notebook>`
- **child** the `<gtk-widget>` to use as the contents of the page.
- **tab-label** the `<gtk-widget>` to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
- **menu-label** the widget to use as a label for the page-switch menu, if that is enabled. If ‘#f’, and `tab-label` is a `<gtk-label>` or ‘#f’, then the menu label will be a newly created label with the same text as `tab-label`; If `tab-label` is not a `<gtk-label>`, `menu-label` must be specified if the page-switch menu is to be used.
- **ret** the index (starting from 0) of the appended page in the notebook, or -1 if function fails

### Prepend Page

**Function**

```python
gtk-notebook-prepend-page (self <gtk-notebook>)
  (child <gtk-widget>) (tab_label <gtk-widget>) ⇒ (ret int)
```

**Method**

**prepend-page**

Prepends a page to `notebook`.

- **notebook** a `<gtk-notebook>`
- **child** the `<gtk-widget>` to use as the contents of the page.
- **tab-label** the `<gtk-widget>` to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
- **ret** the index (starting from 0) of the prepended page in the notebook, or -1 if function fails

### Prepend Page Menu

**Function**

```python
gtk-notebook-prepend-page-menu (self <gtk-notebook>)
  (child <gtk-widget>) (tab_label <gtk-widget>)
  (menu_label <gtk-widget>) ⇒ (ret int)
```

**Method**

**prepend-page-menu**

Prepends a page to `notebook`, specifying the widget to use as the label in the popup menu.

- **notebook** a `<gtk-notebook>`
- **child** the `<gtk-widget>` to use as the contents of the page.
- **tab-label** the `<gtk-widget>` to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
menu-label
the widget to use as a label for the page-switch menu, if that is enabled. If ‘#f’, and tab-label is a <gtk-label> or ‘#f’, then the menu label will be a newly created label with the same text as tab-label; If tab-label is not a <gtk-label>, menu-label must be specified if the page-switch menu is to be used.

ret
the index (starting from 0) of the prepended page in the notebook, or -1 if function fails

gtk-notebook-insert-page (self <gtk-notebook>) (child <gtk-widget>) (tab_label <gtk-widget>) (position int) ⇒ (ret int)
insert-page
Insert a page into notebook at the given position.

notebook a <gtk-notebook>
child the <gtk-widget> to use as the contents of the page.
tab-label the <gtk-widget> to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
position the index (starting at 0) at which to insert the page, or -1 to append the page after all other pages.
ret the index (starting from 0) of the inserted page in the notebook, or -1 if function fails

gtk-notebook-insert-page-menu (self <gtk-notebook>) (child <gtk-widget>) (tab_label <gtk-widget>) (menu_label <gtk-widget>) (position int) ⇒ (ret int)
insert-page-menu
Insert a page into notebook at the given position, specifying the widget to use as the label in the popup menu.

notebook a <gtk-notebook>
child the <gtk-widget> to use as the contents of the page.
tab-label the <gtk-widget> to be used as the label for the page, or ‘#f’ to use the default label, ‘page N’.
menu-label
the widget to use as a label for the page-switch menu, if that is enabled. If ‘#f’, and tab-label is a <gtk-label> or ‘#f’, then the menu label will be a newly created label with the same text as tab-label; If tab-label is not a <gtk-label>, menu-label must be specified if the page-switch menu is to be used.
position the index (starting at 0) at which to insert the page, or -1 to append the page after all other pages.
ret the index (starting from 0) of the inserted page in the notebook
Chapter 100: GtkNotebook

**GtkNotebook**

**Function**

```python
gtk-notebook-remove-page (self <gtk-notebook>) (page_num int)
```

[Method]

Removes a page from the notebook given its index in the notebook.

- **notebook** a `<gtk-notebook>`.
- **page_num** the index of a notebook page, starting from 0. If -1, the last page will be removed.

**Function**

```python
gtk-notebook-page-num (self <gtk-notebook>) (child <gtk-widget>) ⇒ (ret int)
```

[Method]

Finds the index of the page which contains the given child widget.

- **notebook** a `<gtk-notebook>`
- **child** a `<gtk-widget>`
- **ret** the index of the page containing `child`, or -1 if `child` is not in the notebook.

**Function**

```python
gtk-notebook-next-page (self <gtk-notebook>)
```

[Method]

Switches to the next page. Nothing happens if the current page is the last page.

- **notebook** a `<gtk-notebook>`

**Function**

```python
gtk-notebook-prev-page (self <gtk-notebook>)
```

[Method]

Switches to the previous page. Nothing happens if the current page is the first page.

- **notebook** a `<gtk-notebook>`

**Function**

```python
gtk-notebook-reorder-child (self <gtk-notebook>) (child <gtk-widget>) (position int)
```

[Method]

Reorders the page containing `child`, so that it appears in position `position`. If `position` is greater than or equal to the number of children in the list or negative, `child` will be moved to the end of the list.

- **notebook** a `<gtk-notebook>`
- **child** the child to move
- **position** the new position, or -1 to move to the end

**Function**

```python
gtk-notebook-set-tab-pos (self <gtk-notebook>) (pos <gtk-position-type>)
```

[Method]

Sets the edge at which the tabs for switching pages in the notebook are drawn.

- **notebook** a `<gtk-notebook>`.
- **pos** the edge to draw the tabs at.
Chapter 100: GtkNotebook

```c
gtk-notebook-set-show-tabs (self <gtk-notebook>)
    (show_tabs bool)
set-show-tabs
    Sets whether to show the tabs for the notebook or not.

    notebook    a <gtk-notebook>
    show-tabs   ‘#t’ if the tabs should be shown.
```

```c
gtk-notebook-set-show-border (self <gtk-notebook>)
    (show_border bool)
set-show-border
    Sets whether a bevel will be drawn around the notebook pages. This only has a visual
    effect when the tabs are not shown. See gtk-notebook-set-show-tabs.

    notebook    a <gtk-notebook>
    show-border ‘#t’ if a bevel should be drawn around the notebook.
```

```c
gtk-notebook-set-scrollable (self <gtk-notebook>)
    (scrollable bool)
set-scrollable
    Sets whether the tab label area will have arrows for scrolling if there are too many
    tabs to fit in the area.

    notebook    a <gtk-notebook>
    scrollable  ‘#t’ if scroll arrows should be added
```

```c
gtk-notebook-popup-enable (self <gtk-notebook>)
popup-enable
    Enables the popup menu: if the user clicks with the right mouse button on the
    bookmarks, a menu with all the pages will be popped up.

    notebook    a <gtk-notebook>
```

```c
gtk-notebook-popup-disable (self <gtk-notebook>)
popup-disable
    Disables the popup menu.

    notebook    a <gtk-notebook>
```

```c
gtk-notebook-get-current-page (self <gtk-notebook>)
    ⇒ (ret int)
get-current-page
    Returns the page number of the current page.

    notebook    a <gtk-notebook>
    ret          the index (starting from 0) of the current page in the notebook. If the
                 notebook has no pages, then -1 will be returned.
```
Chapter 100: GtkNotebook

```plaintext
gtk-notebook-get-menu-label (self <gtk-notebook>)
    (child <gtk-widget>) ⇒ (ret <gtk-widget>)
    [Function]

get-menu-label
    Retrieves the menu label widget of the page containing child.

    notebook  a <gtk-notebook>
    child      a widget contained in a page of notebook
    ret        the menu label, or ‘#f’ if the notebook page does not have a menu label
               other than the default (the tab label).

```

```plaintext
gtk-notebook-get-nth-page (self <gtk-notebook>) (page_num int)
    ⇒ (ret <gtk-widget>)
    [Function]

get-nth-page
    Returns the child widget contained in page number page-num.

    notebook  a <gtk-notebook>
    page-num  the index of a page in the notebook, or -1 to get the last page.
    ret       the child widget, or ‘#f’ if page-num is out of bounds.

```

```plaintext
gtk-notebook-get-n-pages (self <gtk-notebook>) ⇒ (ret int)
    [Function]

get-n-pages
    Gets the number of pages in a notebook.

    notebook  a <gtk-notebook>
    ret       the number of pages in the notebook.

    Since 2.2
```

```plaintext
gtk-notebook-get-tab-label (self <gtk-notebook>)
    (child <gtk-widget>) ⇒ (ret <gtk-widget>)
    [Function]

get-tab-label
    Returns the tab label widget for the page child. ‘#f’ is returned if child is not in
    notebook or if no tab label has specifically been set for child.

    notebook  a <gtk-notebook>
    child     the page
    ret       the tab label
```

```plaintext
gtk-notebook-set-menu-label (self <gtk-notebook>)
    (child <gtk-widget>) (menu_label <gtk-widget>)
    [Function]

set-menu-label
    Changes the menu label for the page containing child.

    notebook  a <gtk-notebook>
    child     the child widget
    menu-label the menu label, or NULL for default
```
**Function**

`gtk-notebook-set-menu-label-text (self <gtk-notebook>)`  
`(child <gtk-widget>) (menu_text mchars)`

**Method**

**set-menu-label-text**

Sets a new label and sets it as the menu label of `child`.

- `notebook` a `<gtk-notebook>`
- `child` the child widget
- `menu-text` the label text

**Function**

`gtk-notebook-set-tab-label (self <gtk-notebook>)`  
`(child <gtk-widget>) (tab_label <gtk-widget>)`

**Method**

**set-tab-label**

Changes the tab label for `child`. If `'#f'` is specified for `tab-label`, then the page will have the label 'page N'.

- `notebook` a `<gtk-notebook>`
- `child` the page
- `tab-label` the tab label widget to use, or `'#f'` for default tab label.

**Function**

`gtk-notebook-set-tab-label-packing (self <gtk-notebook>)`  
`(child <gtk-widget>) (expand bool) (fill bool) (pack_type <gtk-pack-type>)`

**Method**

**set-tab-label-packing**

Sets the packing parameters for the tab label of the page containing `child`. See `gtk-box-pack-start` for the exact meaning of the parameters.

- `notebook` a `<gtk-notebook>`
- `child` the child widget
- `expand` whether to expand the bookmark or not
- `fill` whether the bookmark should fill the allocated area or not
- `pack-type` the position of the bookmark

**Function**

`gtk-notebook-set-tab-label-text (self <gtk-notebook>)`  
`(child <gtk-widget>) (tab_text mchars)`

**Method**

**set-tab-label-text**

Creates a new label and sets it as the tab label for the page containing `child`.

- `notebook` a `<gtk-notebook>`
- `child` the page
- `tab-text` the label text

**Function**

`gtk-notebook-set-tab-reorderable (self <gtk-notebook>)`  
`(child <gtk-widget>) (reorderable bool)`

**Method**

**set-tab-reorderable**

Sets whether the notebook tab can be reordered via drag and drop or not.

- `notebook` a `<gtk-notebook>`
child a child <gtk-widget>

reorderable whether the tab is reorderable or not.

Since 2.10

gtk-notebook-set-tab-detachable (self <gtk-notebook>) (child <gtk-widget>) (detachable bool)

Sets whether the tab can be detached from notebook to another notebook or widget. Note that 2 notebooks must share a common group identifier (see gtk-notebook-set-group-id) to allow automatic tabs interchange between them.

If you want a widget to interact with a notebook through DnD (i.e.: accept dragged tabs from it) it must be set as a drop destination and accept the target "GTK NOTEBOOK TAB". The notebook will fill the selection with a GtkWidget** pointing to the child widget that corresponds to the dropped tab.

static void
on_drop_zone_drag_data_received (GtkWidget *widget, GdkDragContext *context, gint x, gint y, GtkSelectionData *selection_data, guint info, guint time, gpointer user_data)
{
    GtkWidget *notebook;
    GtkWidget **child;

    notebook = gtk_drag_get_source_widget (context);
    child = (void*) selection_data->data;

    process_widget (*child);
    gtk_container_remove (GTK_CONTAINER (notebook), *child);
}

If you want a notebook to accept drags from other widgets, you will have to set your own DnD code to do it.

notebook a <gtk-notebook>

child a child <gtk-widget>

detachable whether the tab is detachable or not.

Since 2.10
Chapter 100: GشتNotebook

**gtk-notebook-get-menu-label-text** *(self <gtk-notebook>)*

*(child <gtk-widget>)* ⇒ (ret mchars)

**get-menu-label-text**

Retrieves the text of the menu label for the page containing child.

*notebook* a <gtk-notebook>

*child* the child widget of a page of the notebook.

*ret* value: the text of the tab label, or '"f' if the widget does not have a menu label other than the default menu label, or the menu label widget is not a <gtk-label>. The string is owned by the widget and must not be freed.

**gtk-notebook-get-scrollable** *(self <gtk-notebook>)* ⇒ (ret bool)

**get-scrollable**

Returns whether the tab label area has arrows for scrolling. See gšt-notebook-set-scrollable.

*notebook* a <gtk-notebook>

*ret* '"t' if arrows for scrolling are present

**gtk-notebook-get-show-border** *(self <gtk-notebook>)* ⇒ (ret bool)

**get-show-border**

Returns whether a bevel will be drawn around the notebook pages. See gšt-notebook-set-show-border.

*notebook* a <gtk-notebook>

*ret* '"t' if the bevel is drawn

**gtk-notebook-get-show-tabs** *(self <gtk-notebook>)* ⇒ (ret bool)

**get-show-tabs**

Returns whether the tabs of the notebook are shown. See gšt-notebook-set-show-tabs.

*notebook* a <gtk-notebook>

*ret* '"t' if the tabs are shown

**gtk-notebook-get-tab-label-text** *(self <gtk-notebook>)*

*(child <gtk-widget>)* ⇒ (ret mchars)

**get-tab-label-text**

Retrieves the text of the tab label for the page containing child.

*notebook* a <gtk-notebook>

*child* a widget contained in a page of notebook

*ret* value: the text of the tab label, or '"f' if the tab label widget is not a <gtk-label>. The string is owned by the widget and must not be freed.
Chapter 100: GtkNotebook

```gimp
gtk-notebook-get-tab-pos (self <gtk-notebook>) ⇒ (ret <gtk-position-type>)

get-tab-pos
Gets the edge at which the tabs for switching pages in the notebook are drawn.

notebook a <gtk-notebook>
ret the edge at which the tabs are drawn
```

```gimp
gtk-notebook-get-tab-reorderable (self <gtk-notebook>)
  (child <gtk-widget>) ⇒ (ret bool)

get-tab-reorderable
Gets whether the tab can be reordered via drag and drop or not.

notebook a <gtk-notebook>
child a child <gtk-widget>
ret ‘#t’ if the tab is reorderable.

Since 2.10
```

```gimp
gtk-notebook-get-tab-detachable (self <gtk-notebook>)
  (child <gtk-widget>) ⇒ (ret bool)

get-tab-detachable
Returns whether the tab contents can be detached from notebook.

notebook a <gtk-notebook>
child a child <gtk-widget>
ret TRUE if the tab is detachable.

Since 2.10
```

```gimp
gtk-notebook-set-current-page (self <gtk-notebook>)
  (page_num int)

set-current-page
Switches to the page number page-num.

Note that due to historical reasons, GtkNotebook refuses to switch to a page unless
the child widget is visible. Therefore, it is recommended to show child widgets before
adding them to a notebook.

notebook a <gtk-notebook>
page-num index of the page to switch to, starting from 0. If negative, the last page
will be used. If greater than the number of pages in the notebook, nothing
will be done.
```

```gimp
gtk-notebook-set-group-id (self <gtk-notebook>) (group_id int)

set-group-id
Sets an group identificator for notebook, notebooks sharing the same group iden-
tificator will be able to exchange tabs via drag and drop. A notebook with group
identificator -1 will not be able to exchange tabs with any other notebook.
```
notebook a <gtk-notebook>

group-id a group identificator, or -1 to unset it

Since 2.10

gtk-notebook-get-group-id (self <gtk-notebook>) ⇒ (ret int)  [Function]
get-group-id

Gets the current group identificator for notebook.

notebook a <gtk-notebook>

ret the group identificator, or -1 if none is set.

Since 2.10
101 GtkTable

Pack widgets in regular patterns

101.1 Overview

The `<gtk-table>` functions allow the programmer to arrange widgets in rows and columns, making it easy to align many widgets next to each other, horizontally and vertically.

Tables are created with a call to `gtk-table-new`, the size of which can later be changed with `gtk-table-resize`.

Widgets can be added to a table using `gtk-table-attach` or the more convenient (but slightly less flexible) `gtk-table-attach-defaults`.

To alter the space next to a specific row, use `gtk-table-set-row-spacing`, and for a column, `gtk-table-set-col-spacing`.

The gaps between all rows or columns can be changed by calling `gtk-table-set-row-spacings` or `gtk-table-set-col-spacings` respectively.

`gtk-table-set-homogeneous`, can be used to set whether all cells in the table will resize themselves to the size of the largest widget in the table.

101.2 Usage

```plaintext
<gtk-table>
  Derives from `<gtk-container>`.
  This class defines the following slots:
  n-rows   The number of rows in the table
  n-columns The number of columns in the table
  column-spacing The amount of space between two consecutive columns
  row-spacing The amount of space between two consecutive rows
  homogeneous If TRUE, the table cells are all the same width/height

`gtk-table-new (rows unsigned-int) (columns unsigned-int) (homogeneous bool) ⇒ (ret <gtk-widget>)`
  Used to create a new table widget. An initial size must be given by specifying how many rows and columns the table should have, although this can be changed later with `gtk-table-resize`. `rows` and `columns` must both be in the range 0 .. 65535.
  rows       The number of rows the new table should have.
  columns    The number of columns the new table should have.
  homogeneous If set to '#t', all table cells are resized to the size of the cell containing the largest widget.
```
A pointer to the newly created table widget.

gtk-table-resize (self <gtk-table>) (rows unsigned-int) (columns unsigned-int)

resize
If you need to change a table’s size after it has been created, this function allows you to do so.

  table The <gtk-table> you wish to change the size of.
  rows The new number of rows.
  columns The new number of columns.

attach
Adds a widget to a table. The number of ‘cells’ that a widget will occupy is specified by left-attach, right-attach, top-attach and bottom-attach. These each represent the leftmost, rightmost, uppermost and lowest column and row numbers of the table. (Columns and rows are indexed from zero).

  table The <gtk-table> to add a new widget to.
  child The widget to add.
  left-attach the column number to attach the left side of a child widget to.
  right-attach the column number to attach the right side of a child widget to.
  top-attach the row number to attach the top of a child widget to.
  bottom-attach the row number to attach the bottom of a child widget to.
  xoptions Used to specify the properties of the child widget when the table is resized.
  yoptions The same as xoptions, except this field determines behaviour of vertical resizing.
  xpadding An integer value specifying the padding on the left and right of the widget being added to the table.
  ypadding The amount of padding above and below the child widget.

gtk-table-attach-defaults (self <gtk-table>) (widget <gtk-widget>) (left_attach unsigned-int) (right_attach unsigned-int) (top_attach unsigned-int) (bottom_attach unsigned-int)

attach-defaults
As there are many options associated with gtk-table-attach, this convenience function provides the programmer with a means to add children to a table with identical
padding and expansion options. The values used for the `<gtk-attach-options>` are ‘GTK_EXPAND | GTK_FILL’, and the padding is set to 0.

- `table` The table to add a new child widget to.
- `widget` The child widget to add.
- `left-attach` The column number to attach the left side of the child widget to.
- `right-attach` The column number to attach the right side of the child widget to.
- `top-attach` The row number to attach the top of the child widget to.
- `bottom-attach` The row number to attach the bottom of the child widget to.

### gtk-table-set-row-spacing

**Function**

```c
void gtk_table_set_row_spacing (GtkTable *table, guint row, guint spacing);
```

**set-row-spacing**

Changes the space between a given table row and the subsequent row.

- `table` a `<gtk-table>` containing the row whose properties you wish to change.
- `row` row number whose spacing will be changed.
- `spacing` number of pixels that the spacing should take up.

### gtk-table-set-col-spacing

**Function**

```c
void gtk_table_set_col_spacing (GtkTable *table, guint column, guint spacing);
```

**set-col-spacing**

Alters the amount of space between a given table column and the following column.

- `table` a `<gtk-table>.
- `column` the column whose spacing should be changed.
- `spacing` number of pixels that the spacing should take up.

### gtk-table-set-row-spacings

**Function**

```c
void gtk_table_set_row_spacings (GtkTable *table, guint spacing);
```

**set-row-spacings**

Sets the space between every row in `table` equal to `spacing`.

- `table` a `<gtk-table>`.
- `spacing` the number of pixels of space to place between every row in the table.

### gtk-table-set-col-spacings

**Function**

```c
void gtk_table_set_col_spacings (GtkTable *table, guint spacing);
```

**set-col-spacings**

Sets the space between every column in `table` equal to `spacing`.

- `table` a `<gtk-table>`.
- `spacing` the number of pixels of space to place between every column in the table.
**gtk-table-set-homogeneous** (*self <gtk-table>*) (*homogeneous bool*)  
*Function*

**set-homogeneous**  
*Method*

Changes the homogenous property of table cells, i.e., whether all cells are an equal size or not.

*table* The `<gtk-table>` you wish to set the homogeneous properties of.

*homogeneous*  
Set to ‘`#t`’ to ensure all table cells are the same size. Set to ‘`#f`’ if this is not your desired behaviour.

**gtk-table-get-default-row-spacing** (*self <gtk-table]*)  
*Function*

⇒ (*ret* unsigned-int)

**get-default-row-spacing**  
*Method*

Gets the default row spacing for the table. This is the spacing that will be used for newly added rows. (See gtk-table-set-row-spacings)

*table* a `<gtk-table>`

*ret* value: the default row spacing

**gtk-table-get-homogeneous** (*self <gtk-table>*))  
*Function*

⇒ (*ret* bool)

**get-homogeneous**  
*Method*

Returns whether the table cells are all constrained to the same width and height. (See gtk-table-set-homogenous)

*table* a `<gtk-table>`

*ret* ‘`#t`’ if the cells are all constrained to the same size

**gtk-table-get-row-spacing** (*self <gtk-table>*))  
*Function*

`(row unsigned-int) ⇒ (*ret* unsigned-int)

**get-row-spacing**  
*Method*

Gets the amount of space between row `row`, and row `row` + 1. See gtk-table-set-row-spacing.

*table* a `<gtk-table>`

*row* a row in the table, 0 indicates the first row

*ret* the row spacing

**gtk-table-get-col-spacing** (*self <gtk-table>*))  
*Function*

`(column unsigned-int) ⇒ (*ret* unsigned-int)

**get-col-spacing**  
*Method*

Gets the amount of space between column `col`, and column `col` + 1. See gtk-table-set-col-spacing.

*table* a `<gtk-table>`

*column* a column in the table, 0 indicates the first column

*ret* the column spacing
gtk-table-get-default-col-spacing (self <gtk-table>)  
⇒ (ret unsigned-int)  

get-default-col-spacing  
Gets the default column spacing for the table. This is the spacing that will be used for newly added columns. (See gtk-table-set-col-spacings)

  table a <gtk-table>

  ret value: the default column spacing
102 GtkExpander

A container which can hide its child

102.1 Overview

A `<gtk-expander>` allows the user to hide or show its child by clicking on an expander triangle similar to the triangles used in a `<gtk-tree-view>`.

Normally you use an expander as you would use any other descendant of `<gtk-bin>`; you create the child widget and use `gtk-container-add` to add it to the expander. When the expander is toggled, it will take care of showing and hiding the child automatically.

There are situations in which you may prefer to show and hide the expanded widget yourself, such as when you want to actually create the widget at expansion time. In this case, create a `<gtk-expander>` but do not add a child to it. The expander widget has an ‘expanded’ property which can be used to monitor its expansion state. You should watch this property with a signal connection as follows:

```c
expander = gtk_expander_new_with_mnemonic("_More Options");
g_signal_connect (expander, "notify::expanded",
  G_CALLBACK (expander_callback), NULL);
...

static void
expander_callback (GObject *object,
  GParamSpec *param_spec,
  gpointer user_data)
{
  GtkExpander *expander;

  expander = GTK_EXPANDER (object);

  if (gtk_expander_get_expanded (expander))
    { /* Show or create widgets */
    }
  else
    { /* Hide or destroy widgets */
    }
}
```
102.2 Usage

<gtk-expander> [Class]

Derives from <gtk-bin>.

This class defines the following slots:

expanded Whether the expander has been opened to reveal the child widget
label Text of the expander’s label
use-underline If set, an underline in the text indicates the next character should be used for the mnemonic accelerator key
use-markup The text of the label includes XML markup. See pango::parse::markup()
spacing Space to put between the label and the child
label-widget A widget to display in place of the usual expander label

activate [Signal on <gtk-expander>]

gtk-expander-new (label mchars) ⇒ (ret <gtk-widget>) [Function]

Creates a new expander using label as the text of the label.

label the text of the label
ret a new <gtk-expander> widget.

Since 2.4

gtk-expander-new-with-mnemonic (label mchars) [Function]

⇒ (ret <gtk-widget>)

Creates a new expander using label as the text of the label. If characters in label are preceded by an underscore, they are underlined. If you need a literal underscore character in a label, use ‘\_\_’ (two underscores). The first underlined character represents a keyboard accelerator called a mnemonic. Pressing Alt and that key activates the button.

label the text of the label with an underscore in front of the mnemonic character
ret a new <gtk-expander> widget.

Since 2.4

gtk-expander-set-expanded (self <gtk-expander>) (expanded bool) [Function]

set-expanded [Method]

Sets the state of the expander. Set to ‘#t’, if you want the child widget to be revealed, and ‘#f’ if you want the child widget to be hidden.

expander a <gtk-expander>
expanded whether the child widget is revealed

Since 2.4
Chapter 102: GtkExpander

```grundl
gtk-expander-get-expanded (self <gtk-expander>) ⇒ (ret bool) [Function]
gtk-expander-get-expanded
Queries a <gtk-expander> and returns its current state. Returns ‘#t’ if the child widget is revealed.
See gtk-expander-set-expanded.

expander  a <gtk-expander>
ret        the current state of the expander.
Since 2.4
```

```grundl
gtk-expander-set-spacing (self <gtk-expander>) (spacing int) [Function]
gtk-expander-set-spacing
Sets the spacing field of expander, which is the number of pixels to place between expander and the child.

expander  a <gtk-expander>
spacing   distance between the expander and child in pixels.
Since 2.4
```

```grundl
gtk-expander-get-spacing (self <gtk-expander>) ⇒ (ret int) [Function]
gtk-expander-get-spacing
Gets the value set by gtk-expander-set-spacing.

expander  a <gtk-expander>
ret        spacing between the expander and child.
Since 2.4
```

```grundl
gtk-expander-set-label (self <gtk-expander>) (label mchars) [Function]
gtk-expander-set-label
Sets the text of the label of the expander to label. This will also clear any previously set labels.

expander  a <gtk-expander>
label     a string
Since 2.4
```

```grundl
gtk-expander-get-label (self <gtk-expander>) ⇒ (ret mchars) [Function]
gtk-expander-get-label
Fetches the text from the label of the expander, as set by gtk-expander-set-label. If the label text has not been set the return value will be ‘#f’. This will be the case if you create an empty button with gtk-button-new to use as a container.

expander  a <gtk-expander>
ret        The text of the label widget. This string is owned by the widget and must not be modified or freed.
Since 2.4
```
**gtk-expander-set-use-underline** (*self* <gtk-expander>)(
  (*use_underline* bool)
)

**set-use-underline**

If true, an underline in the text of the expander label indicates the next character should be used for the mnemonic accelerator key.

*expander*  a <gtk-expander>

*use_underline*  

'`#t`' if underlines in the text indicate mnemonics

Since 2.4

**gtk-expander-get-use-underline** (*self* <gtk-expander>)(
  ⇒ (*ret* bool)
)

**get-use-underline**

Returns whether an embedded underline in the expander label indicates a mnemonic. See `gtk-expander-set-use-underline`.

*expander*  a <gtk-expander>

*ret*  

'`#t`' if an embedded underline in the expander label indicates the mnemonic accelerator keys.

Since 2.4

**gtk-expander-set-use-markup** (*self* <gtk-expander>)(
  (*use_markup* bool)
)

**set-use-markup**

Sets whether the text of the label contains markup in Pango's text markup language. See `gtk-label-set-markup`.

*expander*  a <gtk-expander>

*use_markup*  

'`#t`' if the label's text should be parsed for markup

Since 2.4

**gtk-expander-get-use-markup** (*self* <gtk-expander>)(
  ⇒ (*ret* bool)
)

**get-use-markup**

Returns whether the label's text is interpreted as marked up with the Pango text markup language. See `gtk-expander-set-use-markup`.

*expander*  a <gtk-expander>

*ret*  

'`#t`' if the label's text will be parsed for markup

Since 2.4

**gtk-expander-set-label-widget** (*self* <gtk-expander>)(
  (*label_widget* <gtk-widget>)
)

**set-label-widget**

Set the label widget for the expander. This is the widget that will appear embedded alongside the expander arrow.
expander a <gtk-expander>

label-widget
the new label widget

Since 2.4

gtk-expander-get-label-widget (self <gtk-expander>) [Function]
⇒ (ret <gtk-widget>)

get-label-widget [Method]
Retrieves the label widget for the frame. See gtk-expander-set-label-widget.

expander a <gtk-expander>
ret the label widget, or ‘#f’ if there is none.

Since 2.4
103 GtkFrame

A bin with a decorative frame and optional label

103.1 Overview

The frame widget is a Bin that surrounds its child with a decorative frame and an optional label. If present, the label is drawn in a gap in the top side of the frame. The position of the label can be controlled with `gtk-frame-set-label-align`.

103.2 Usage

`<gtk-frame>`

This class defines the following slots:

- `label` Text of the frame’s label
- `label-xalign` The horizontal alignment of the label
- `label-yalign` The vertical alignment of the label
- `shadow` Deprecated property, use `shadow-type` instead
- `shadow-type` Appearance of the frame border
- `label-widget` A widget to display in place of the usual frame label

`gtk-frame-new (label mchars) ⇒ (ret <gtk-widget>)`

Creates a new `<gtk-frame>`, with optional label `label`. If `label` is ‘#f’, the label is omitted.

- `label` the text to use as the label of the frame
- `ret` a new `<gtk-frame>` widget

`gtk-frame-set-label (self <gtk-frame>) (label mchars)`

Sets the text of the label. If `label` is ‘#f’, the current label is removed.

- `frame` a `<gtk-frame>`
- `label` the text to use as the label of the frame

`gtk-frame-set-label-widget (self <gtk-frame>) (label_widget <gtk-widget>)`

Sets the label widget for the frame. This is the widget that will appear embedded in the top edge of the frame as a title.
Chapter 103: GtkFrame

frame  a <gtk-frame>

label-widget  the new label widget

gtk-frame-set-label-align (self <gtk-frame>) (xalign float)  [Function]
set-label-align  [Method]

Sets the alignment of the frame widget’s label. The default values for a newly created frame are 0.0 and 0.5.

frame  a <gtk-frame>
xalign  The position of the label along the top edge of the widget. A value of 0.0 represents left alignment; 1.0 represents right alignment.
yalign  The y alignment of the label. A value of 0.0 aligns under the frame; 1.0 aligns above the frame.

gtk-frame-set-shadow-type (self <gtk-frame>)  [Function]
(set-shadow-type)
set-shadow-type  [Method]

Sets the shadow type for frame.

frame  a <gtk-frame>
type  the new <gtk-shadow-type>

gtk-frame-get-label (self <gtk-frame>) ⇒ (ret mchars)  [Function]
get-label  [Method]

If the frame’s label widget is a <gtk-label>, returns the text in the label widget. (The frame will have a <gtk-label> for the label widget if a non-’#f’ argument was passed to gtk-frame-new.)

frame  a <gtk-frame>
ret  the text in the label, or ‘#f’ if there was no label widget or the label widget was not a <gtk-label>. This string is owned by GTK+ and must not be modified or freed.

gtk-frame-get-label-align (self <gtk-frame>) ⇒ (xalign float)  [Function]
get-label-align  [Method]

Retrieves the X and Y alignment of the frame’s label. See gtk-frame-set-label-align.

frame  a <gtk-frame>
xalign  location to store X alignment of frame’s label, or ‘#f’
yalign  location to store X alignment of frame’s label, or ‘#f’

gtk-frame-get-label-widget (self <gtk-frame>)  [Function]
⇒ (ret <gtk-widget>)
get-label-widget  [Method]

Retrieves the label widget for the frame. See gtk-frame-set-label-widget.
frame a <gtk-frame>
ret the label widget, or ‘#f’ if there is none.

gtk-frame-get-shadow-type (self <gtk-frame>) [Function]
⇒ (ret <gtk-shadow-type>)

get-shadow-type [Method]
Retrieves the shadow type of the frame. See gtk-frame-set-shadow-type.

frame a <gtk-frame>
ret the current shadow type of the frame.
104 GtkHSeparator

A horizontal separator

104.1 Overview

The `<gtk-hseparator>` widget is a horizontal separator, used to group the widgets within a window. It displays a horizontal line with a shadow to make it appear sunken into the interface.

The `<gtk-hseparator>` widget is not used as a separator within menus. To create a separator in a menu create an empty `<gtk-separator-menu-item>` widget using `gtk-separator-menu-item-new` and add it to the menu with `gtk-menu-shell-append`.

104.2 Usage

```
<gtk-hseparator> [Class]
    Derives from `<gtk-separator>`.
    This class defines no direct slots.

gtk-hseparator-new ⇒ (ret <gtk-widget>) [Function]
    Creates a new `<gtk-hseparator>`.
    ret a new `<gtk-hseparator>`.
```
105 GtkVSeparator

A vertical separator

105.1 Overview

The <gtk-vseparator> widget is a vertical separator, used to group the widgets within a window. It displays a vertical line with a shadow to make it appear sunken into the interface.

105.2 Usage

<gtk-vseparator>  [Class]
Derives from <gtk-separator>.
This class defines no direct slots.

gtk-vseparator-new ⇒ (ret <gtk-widget> )  [Function]
Creates a new <gtk-vseparator>.
ret a new <gtk-vseparator>.
106 GtkHScrollbar

A horizontal scrollbar

106.1 Overview

The `<gtk-hscrollbar>` widget is a widget arranged horizontally creating a scrollbar. See `<gtk-scrollbar>` for details on scrollbars. `<gtk-adjustment>` pointers may be added to handle the adjustment of the scrollbar or it may be left ‘#f’ in which case one will be created for you. See `<gtk-adjustment>` for details.

106.2 Usage

```
<gtk-hscrollbar>                        [Class]
    Derives from `<gtk-scrollbar>`.
    This class defines no direct slots.

gtk-hscrollbar-new (adjustment <gtk-adjustment>)  [Function]
    ⇒ (ret <gtk-widget>)
    Creates a new horizontal scrollbar.
    adjustment
        the `<gtk-adjustment>` to use, or ‘#f’ to create a new adjustment.
    ret
        the new `<gtk-hscrollbar>`.```
107 GtkVScrollbar

A vertical scrollbar

107.1 Overview

The `<gtk-vscrollbar>` widget is a widget arranged vertically creating a scrollbar. See `<gtk-scrollbar>` for details on scrollbars. `<gtk-adjustment>` pointers may be added to handle the adjustment of the scrollbar or it may be left `'#f'` in which case one will be created for you. See `<gtk-adjustment>` for details.

107.2 Usage

```
<gtk-vscrollbar>  [Class]
    Derives from `<gtk-scrollbar>`. This class defines no direct slots.

gtk-vscrollbar-new (adjustment <gtk-adjustment>)  [Function]
    Creates a new vertical scrollbar.
    adjustment  the `<gtk-adjustment>` to use, or `'#f'` to create a new adjustment.
    ret  the new `<gtk-vscrollbar>`
```
Chapter 108: GtkScrolledWindow

108 GtkScrolledWindow

Adds scrollbars to its child widget

108.1 Overview

<gtk-scrolled-window> is a <gtk-bin> subclass: it’s a container that accepts a single child widget. <gtk-scrolled-window> adds scrollbars to the child widget and optionally draws a beveled frame around the child widget.

The scrolled window can work in two ways. Some widgets have native scrolling support; these widgets have "slots" for <gtk-adjustment> objects. Widgets with native scroll support include <gtk-tree-view>, <gtk-text-view>, and <gtk-layout>.

The scrolled window installs <gtk-adjustment> objects in the child window’s slots using the set_scroll_adjustments_signal, found in <gtk-widget-class>. (Conceptually, these widgets implement a "Scrollable" interface; because GTK+ 1.2 lacked interface support in the object system, this interface is hackily implemented as a signal in <gtk-widget-class>. The GTK+ 2.0 object system would allow a clean implementation, but it wasn’t worth breaking the API.)

For widgets that lack native scrolling support, the <gtk-viewport> widget acts as an adaptor class, implementing scrollability for child widgets that lack their own scrolling capabilities. Use <gtk-viewport> to scroll child widgets such as <gtk-table>, <gtk-box>, and so on.

If a widget has native scrolling abilities, it can be added to the <gtk-scrolled-window> with gtk-container-add. If a widget does not, you must first add the widget to a <gtk-viewport>, then add the <gtk-viewport> to the scrolled window. The convenience function gtk-scrolled-window-add-with-viewport does exactly this, so you can ignore the presence of the viewport.

The position of the scrollbars is controlled by the scroll adjustments. See <gtk-adjustment> for the fields in an adjustment - for <gtk-scrollbar>, used by <gtk-scrolled-window>, the "value" field represents the position of the scrollbar, which must be between the "lower" field and "upper - page.size." The "page.size" field represents the size of the visible scrollable area. The "step.increment" and "page.increment" fields are used when the user asks to step down (using the small stepper arrows) or page down (using for example the PageDown key).

If a <gtk-scrolled-window> doesn’t behave quite as you would like, or doesn’t have exactly the right layout, it’s very possible to set up your own scrolling with <gtk-scrollbar> and for example a <gtk-table>.

108.2 Usage

<gtk-scrolled-window> [Class]

Derives from <gtk-bin>.

This class defines the following slots:

hadjustment

The GtkAdjustment for the horizontal position
vadjustment
The GtkAdjustment for the vertical position

hscrollbar-policy
When the horizontal scrollbar is displayed

vscrollbar-policy
When the vertical scrollbar is displayed

window-placement
Where the contents are located with respect to the scrollbars. This property only takes effect if "window-placement-set" is TRUE.

window-placement-set
Whether "window-placement" should be used to determine the location of the contents with respect to the scrollbars.

shadow-type
Style of bevel around the contents

move-focus-out
[Signal on <gtk-scrolled-window>]
(arg0 <gtk-direction-type>)

scroll-child (arg0 <gtk-scroll-type>)
[Signal on <gtk-scrolled-window>]
(arg1 <gboolean>) ⇒ <gboolean>

gtk-scrolled-window-new (hadjustment <gtk-adjustment>)
[Function]
(vadjustment <gtk-adjustment>) ⇒ (ret <gtk-widget>)
Creates a new scrolled window. The two arguments are the scrolled window’s adjustments; these will be shared with the scrollbars and the child widget to keep the bars in sync with the child. Usually you want to pass ‘#f’ for the adjustments, which will cause the scrolled window to create them for you.

hadjustment
Horizontal adjustment.

vadjustment
Vertical adjustment.

ret
New scrolled window.

gtk-scrolled-window-get-hadjustment
[Function]
(ret <gtk-adjustment>)

get-hadjustment
[Method]
Returns the horizontal scrollbar’s adjustment, used to connect the horizontal scrollbar to the child widget’s horizontal scroll functionality.

scrolled-window
A <gtk-scrolled-window>.

ret
The horizontal <gtk-adjustment>.

gtk-scrolled-window-get-vadjustment
[Function]
(ret <gtk-adjustment>)

get-vadjustment
[Method]
Returns the vertical scrollbar’s adjustment, used to connect the vertical scrollbar to the child widget’s vertical scroll functionality.
scrolled-window
A <gtk-scrolled-window>.

ret The vertical <gtk-adjustment>.

gtk-scrolled-window-get-hscrollbar  [Function]
(self <gtk-scrolled-window>) ⇒ (ret <gtk-widget>)
get-hscrollbar
Returns the horizontal scrollbar of scrolled-window.

scrolled-window
a <gtk-scrolled-window>

ret the horizontal scrollbar of the scrolled window, or ‘#f’ if it does not have one.

Since 2.8

gtk-scrolled-window-get-vscrollbar  [Function]
(self <gtk-scrolled-window>) ⇒ (ret <gtk-widget>)
get-vscrollbar
Returns the vertical scrollbar of scrolled-window.

scrolled-window
a <gtk-scrolled-window>

ret the vertical scrollbar of the scrolled window, or ‘#f’ if it does not have one.

Since 2.8

gtk-scrolled-window-set-policy  [Function]
(self <gtk-scrolled-window>)
(hscrollbar_policy <gtk-policy-type>)
(vscrollbar_policy <gtk-policy-type>)
set-policy
Sets the scrollbar policy for the horizontal and vertical scrollbars. The policy determines when the scrollbar should appear; it is a value from the <gtk-policy-type> enumeration. If ‘GTK_POLICY_ALWAYS’, the scrollbar is always present; if ‘GTK_POLICY_NEVER’, the scrollbar is never present; if ‘GTK_POLICY_AUTOMATIC’, the scrollbar is present only if needed (that is, if the slider part of the bar would be smaller than the trough - the display is larger than the page size).

scrolled-window
A <gtk-scrolled-window>.

hscrollbar-policy
Policy for horizontal bar.

vscrollbar-policy
Policy for vertical bar.
gtk-scrolled-window-set-placement

(self <gtk-scrolled-window>) (window-placement <gtk-corner-type>)

Sets the placement of the contents with respect to the scrollbars for the scrolled window.

See also gtk-scrolled-window-get-placement and gtk-scrolled-window-unset-placement.

Determines the location of the child widget with respect to the scrollbars. The default is 'GTK_CORNER_TOP_LEFT', meaning the child is in the top left, with the scrollbars underneath and to the right. Other values in <gtk-corner-type> are 'GTK_CORNER_TOP_RIGHT', 'GTK_CORNER_BOTTOM_LEFT', and 'GTK_CORNER_BOTTOM_RIGHT'.

scrolled-window
  a <gtk-scrolled-window>

window-placement
  Position of the child window.

gtk-scrolled-window-unset-placement

(self <gtk-scrolled-window>)

Unsets the placement of the contents with respect to the scrollbars for the scrolled window. If no window placement is set for a scrolled window, it obeys the "gtk-scrolled-window-placement" XSETTING.

See also gtk-scrolled-window-set-placement and gtk-scrolled-window-get-placement.

scrolled-window
  a <gtk-scrolled-window>

Since 2.10

gtk-scrolled-window-set-shadow-type

(self <gtk-scrolled-window>) (type <gtk-shadow-type>)

Changes the type of shadow drawn around the contents of scrolled-window.

scrolled-window
  a <gtk-scrolled-window>

type
  kind of shadow to draw around scrolled window contents

gtk-scrolled-window-set-hadjustment

(self <gtk-scrolled-window>) (hadjustment <gtk-adjustment>)

Sets the <gtk-adjustment> for the horizontal scrollbar.

scrolled-window
  A <gtk-scrolled-window>.

hadjustment
  Horizontal scroll adjustment.
gtk-scrolled-window-set-vadjustment [Function]  
(self <gtk-scrolled-window>) (vadjustment <gtk-adjustment>)

set-vadjustment [Method]  
Sets the <gtk-adjustment> for the vertical scrollbar.

scrolled-window  
A <gtk-scrolled-window>.

vadjustment  
Vertical scroll adjustment.

gtk-scrolled-window-get-placement [Function]  
(self <gtk-scrolled-window>) ⇒ (ret <gtk-corner-type>)

get-placement [Method]  
Gets the placement of the contents with respect to the scrollbars for the scrolled window. See gtk-scrolled-window-set-placement.

scrolled-window  
a <gtk-scrolled-window>

ret  
the current placement value. See also gtk-scrolled-window-set-placement and gtk-scrolled-window-unset-placement.

gtk-scrolled-window-get-shadow-type [Function]  
(self <gtk-scrolled-window>) ⇒ (ret <gtk-shadow-type>)

get-shadow-type [Method]  
Gets the shadow type of the scrolled window. See gtk-scrolled-window-set-shadow-type.

scrolled-window  
a <gtk-scrolled-window>

ret  
the current shadow type
109 GtkPrintOperation

High-level Printing API

109.1 Overview

GtkPrintOperation is the high-level, portable printing API. It looks a bit different than other GTK+ dialogs such as the <gtk-file-chooser>, since some platforms don’t expose enough infrastructure to implement a good print dialog. On such platforms, GtkPrintOperation uses the native print dialog. On platforms which do not provide a native print dialog, GTK+ uses its own, see <gtk-print-unix-dialog>.

The typical way to use the high-level printing API is to create a <gtk-print-operation> object with gtk-print-operation-new when the user selects to print. Then you set some properties on it, e.g. the page size, any <gtk-print-settings> from previous print operations, the number of pages, the current page, etc.

Then you start the print operation by calling gtk-print-operation-run. It will then show a dialog, let the user select a printer and options. When the user finished the dialog various signals will be emitted on the <gtk-print-operation>, the main one being ::draw-page, which you are supposed to catch and render the page on the provided <gtk-print-context> using Cairo.

```c
static GtkPrintSettings *settings = NULL;

static void
do_print (void)
{
  GtkWidget *print;
  GtkWidget *res;

  print = gtk_print_operation_new ();

  if (settings != NULL)
    gtk_print_operation_set_print_settings (print, settings);

g_signal_connect (print, "begin_print", G_CALLBACK (begin_print), NULL);
g_signal_connect (print, "draw_page", G_CALLBACK (draw_page), NULL);

  res = gtk_print_operation_run (print, GTK_PRINT_OPERATION_ACTION_PRINT_DIALOG,
                              GTK_WINDOW (main_window), NULL);

  if (res == GTK_PRINT_OPERATION_RESULT_APPLY)
    {
      if (settings != NULL)
        g_object_unref (settings);
      settings = g_object_ref (gtk_print_operation_get_print_settings (print));
    }
```
By default GtkPrintOperation uses an external application to do print preview. To implement a custom print preview, an application must connect to the preview signal. The functions `gtk-print-operation-print-preview-render-page`, `gtk-print-operation-preview-end-preview` and `gtk-print-operation-preview-is-selected` are useful when implementing a print preview.

Printing support was added in GTK+ 2.10.

### 109.2 Usage

```
<gtk-print-operation>

[Class]
```

Derives from `<gtk-print-operation-preview>`, `<gobject>`.

This class defines the following slots:

- **default-page-setup**
  The GtkPageSetup used by default

- **print-settings**
  The GtkPrintSettings used for initializing the dialog

- **job-name**
  A string used for identifying the print job.

- **n-pages**
  The number of pages in the document.

- **current-page**
  The current page in the document

- **use-full-page**
  TRUE if the origin of the context should be at the corner of the page and not the corner of the imageable area

- **track-print-status**
  TRUE if the print operation will continue to report on the print job status after the print data has been sent to the printer or print server.

- **unit**
  The unit in which distances can be measured in the context

- **show-progress**
  TRUE if a progress dialog is shown while printing.

- **allow-async**
  TRUE if print process may run asynchronous.

- **export-filename**
  Export filename

- **status**
  The status of the print operation

- **status-string**
  A human-readable description of the status

- **custom-tab-label**
  Label for the tab containing custom widgets.
**done** (*arg0 <gtk-print-operation-result>*)  [Signal on <gtk-print-operation>]
Emitted when the print operation run has finished doing everything required for printing. *result* gives you information about what happened during the run. If *result* is ‘(GTK_PRINT_OPERATION_RESULT_ERROR)’ then you can call *gtk-print-operation-get-error* for more information.

If you enabled print status tracking then *gtk-print-operation-is-finished* may still return ‘#f’ after this was emitted.

Since 2.10

**begin-print** (*arg0 <gtk-print-context>*)  [Signal on <gtk-print-operation>]
Emitted after the user has finished changing print settings in the dialog, before the actual rendering starts.

A typical use for this signal is to use the parameters from the *<gtk-print-context>* and paginate the document accordingly, and then set the number of pages with *gtk-print-operation-set-n-pages*.

Since 2.10

**paginate** (*arg0 <gtk-print-context>*)  [Signal on <gtk-print-operation>]
⇒ <gboolean>
Emitted after the begin-print signal, but before the actual rendering starts. It keeps getting emitted until it returns ‘#f’.

This signal is intended to be used for paginating the document in small chunks, to avoid blocking the user interface for a long time. The signal handler should update the number of pages using *gtk-print-operation-set-n-pages*, and return ‘#t’ if the document has been completely paginated.

If you don’t need to do pagination in chunks, you can simply do it all in the begin-print handler, and set the number of pages from there.

Since 2.10

**request-page-setup**  [Signal on <gtk-print-operation>]
(*arg0 <gtk-print-context>* (*arg1 <gint>* (*arg2 <gtk-page-setup>*)))
Emitted once for every page that is printed, to give the application a chance to modify the page setup. Any changes done to *setup* will be in force only for printing this page.

Since 2.10

**draw-page** (*arg0 <gtk-print-context>*)
(*arg1 <gint>*)
Emitted for every page that is printed. The signal handler must render the *page-nr*’s page onto the cairo context obtained from *context* using *gtk-print-context-get-cairo-context*.

```c
static void
draw_page (GtkPrintOperation *operation,
            GtkWidget *context,
            gint page_nr,
            gpointer user_data)
```

```c
{  cairo_t *cr;
   PangoLayout *layout;
   gdouble width, text_height;
   gint layout_height;
   PangoFontDescription *desc;

   cr = gtk_print_context_get_cairo_context (context);
   width = gtk_print_context_get_width (context);

   cairo_rectangle (cr, 0, 0, width, HEADER_HEIGHT);

   cairo_set_source_rgb (cr, 0.8, 0.8, 0.8);
   cairo_fill (cr);

   layout = gtk_print_context_create_pango_layout (context);

   desc = pango_font_description_from_string ("sans 14");
   pango_layout_set_font_description (layout, desc);
   pango_font_description_free (desc);

   pango_layout_set_text (layout, "some text", -1);
   pango_layout_set_width (layout, width);
   pango_layout_set_alignment (layout, PANGO_ALIGN_CENTER);

   pango_layout_get_size (layout, NULL, &layout_height);
   text_height = (gdouble)layout_height / PANGO_SCALE;

   cairo_move_to (cr, width / 2, (HEADER_HEIGHT - text_height) / 2);
   pango_cairo_show_layout (cr, layout);

   g_object_unref (layout);
}
```

Use `gtk-print-operation-set-use-full-page` and `gtk-print-operation-set-unit` before starting the print operation to set up the transformation of the cairo context according to your needs.

Since 2.10

`end-print (arg0 <gtk-print-context>)`  
[Signal on `<gtk-print-operation>`]

Emitted after all pages have been rendered. A handler for this signal can clean up any resources that have been allocated in the ::begin-print handler.

Since 2.10

`status-changed`  
[Signal on `<gtk-print-operation>`]

Emitted at between the various phases of the print operation. See `<gtk-print-status>` for the phases that are being discriminated. Use `gtk-print-operation-get-status` to find out the current status.
Since 2.10

**create-custom-widget ⇒ <gobject>**  
[Signal on <gtk-print-operation>]
Emitted when displaying the print dialog. If you return a widget in a handler for this signal it will be added to a custom tab in the print dialog. You typically return a container widget with multiple widgets in it.

The print dialog owns the returned widget, and its lifetime isn’t controlled by the app. However, the widget is guaranteed to stay around until the custom-widget-apply signal is emitted on the operation. Then you can read out any information you need from the widgets.

Since 2.10

**custom-widget-apply (arg0 <gtk-widget>)**  
[Signal on <gtk-print-operation>]
Emitted right before begin-print if you added a custom widget in the create-custom-widget handler. When you get this signal you should read the information from the custom widgets, as the widgets are not guaranteed to be around at a later time.

Since 2.10

**preview**  
[Signal on <gtk-print-operation>]

\((arg0 <gtk-print-operation-preview>) (arg1 <gtk-print-context>) (arg2 <gtk-window>) ⇒ <gboolean>\)
\nGets emitted when a preview is requested from the native dialog.

The default handler for this signal uses an external viewer application to preview.

To implement a custom print preview, an application must return ‘#t’ from its handler for this signal. In order to use the provided context for the preview implementation, it must be given a suitable cairo context with `gtk-print-context-set-cairo-context`.

The custom preview implementation can use `gtk-print-operation-preview-is-selected` and `gtk-print-operation-preview-render-page` to find pages which are selected for print and render them. The preview must be finished by calling `gtk-print-operation-preview-end-preview` (typically in response to the user clicking a close button).

Since 2.10

**<gtk-print-operation-preview>**  
[Class]

Derives from `<ginterface>`.

This class defines no direct slots.

**ready (arg0 <gtk-print-context>)**  
[Signal on <gtk-print-operation-preview>]
undocumented

**got-page-size**  
[Signal on <gtk-print-operation-preview>]

\((arg0 <gtk-print-context>) (arg1 <gtk-page-setup>)\)
undocumented

**gtk-print-operation-new ⇒ (ret <gtk-print-operation>)**  
[Function]

Creates a new `<gtk-print-operation>`. 

Since 2.10
ret a new `<gtk-print-operation>`

Since 2.10

`gtk-print-operation-set-allow-async` [Function]

```c
(set self <gtk-print-operation>) (allow_async bool)
```

set-allow-async [Method]
Sets whether the `gtk-print-operation-run` may return before the print operation is completed. Note that some platforms may not allow asynchronous operation.

```c
op a <gtk-print-operation>
allow-async
  '#t' to allow asynchronous operation
```

Since 2.10

`gtk-print-operation-get-error` [Function]

```c
(get-error self <gtk-print-operation>)
```

get-error [Method]
Call this when the result of a print operation is `GTK_PRINT_OPERATION_RESULT_ERROR`, either as returned by `gtk-print-operation-run`, or in the `::done` signal handler. The returned `<g-error>` will contain more details on what went wrong.

```c
op a <gtk-print-operation>
error return location for the error
```

Since 2.10

`gtk-print-operation-set-job-name` [Function]

```c
(set-job-name self <gtk-print-operation>) (job_name mchars)
```

set-job-name [Method]
Sets the name of the print job. The name is used to identify the job (e.g. in monitoring applications like eggcups).

If you don’t set a job name, GTK+ picks a default one by numbering successive print jobs.

```c
op a <gtk-print-operation>
job-name a string that identifies the print job
```

Since 2.10

`gtk-print-operation-set-n-pages` [Function]

```c
(set-n-pages self <gtk-print-operation>) (n_pages int)
```

set-n-pages [Method]
Sets the number of pages in the document.

This *must* be set to a positive number before the rendering starts. It may be set in a `::begin-print` signal handler.

Note that the page numbers passed to the `::request-page-setup` and `::draw-page` signals are 0-based, i.e. if the user chooses to print all pages, the last `::draw-page` signal will be for page `n-pages - 1`.

```c
op a <gtk-print-operation>
```
Chapter 109: GtkPrintOperation 444

\[ n \text{-pages} \quad \text{the number of pages} \]

Since 2.10

**gtk-print-operation-set-unit** *(self <gtk-print-operation>) [Function]*

(set-unit <gtk-unit>)

**set-unit** [Method]
Sets up the transformation for the cairo context obtained from <gtk-print-context> in such a way that distances are measured in units of \( \text{unit} \).

\( \text{op} \) a <gtk-print-operation>

**unit** the unit to use

Since 2.10

**gtk-print-operation-run** *(self <gtk-print-operation>) [Function]*

(action <gtk-print-operation-action>) (parent <gtk-window>)

⇒ (ret <gtk-print-operation-result>)

**run** [Method]
Runs the print operation, by first letting the user modify print settings in the print dialog, and then print the document.

Normally that this function does not return until the rendering of all pages is complete. You can connect to the ::status-changed signal on \( \text{op} \) to obtain some information about the progress of the print operation. Furthermore, it may use a recursive mainloop to show the print dialog.

If you call **gtk-print-operation-set-allow-async** or set the allow-async property the operation will run asynchronously if this is supported on the platform. The ::done signal will be emitted with the operation results when the operation is done (i.e. when the dialog is canceled, or when the print succeeds or fails).

```c
if (settings != NULL)
    gtk_print_operation_set_print_settings (print, settings);

if (page_setup != NULL)
    gtk_print_operation_set_default_page_setup (print, page_setup);

g_signal_connect (print, "begin-print",
    G_CALLBACK (begin_print), &data);

res = gtk_print_operation_run (print, GTK_PRINT_OPERATION_ACTION_PRINT_DIALOG, parent, &error);

if (res == GTK_PRINT_OPERATION_RESULT_ERROR)
{
    error_dialog = gtk_message_dialog_new (GTK_WINDOW (parent),
        GTK_DIALOG_DESTROY_WITH_PARENT,
        GTK_MESSAGE_ERROR,
        &error,
        GTK_BUTTONS_OK);
    
    if (res == GTK_PRINT_OPERATION_RESULT_ERROR)
    { 
        error_dialog = gtk_message_dialog_new (GTK_WINDOW (parent),
            GTK_DIALOG_DESTROY_WITH_PARENT,
            GTK_MESSAGE_ERROR, 

        
```
GTK_BUTTONS_CLOSE,
    "Error printing file:
\n%s",
error->message);
    g_signal_connect (error_dialog, "response",
      G_CALLBACK (gtk_widget_destroy), NULL);
    gtk_widget_show (error_dialog);
    g_error_free (error);
}
else if (res == GTK_PRINT_OPERATION_RESULT_APPLY)
{
    if (settings != NULL)
        g_object_unref (settings);
    settings = g_object_ref (gtk_print_operation_get_print_settings (print));
}

Note that `gtk-print-operation-run` can only be called once on a given `<gtk-print-operation>`.

- **op** a `<gtk-print-operation>`
- **action** the action to start
- **parent** Transient parent of the dialog, or ‘#f’
- **error** Return location for errors, or ‘#f’
- **ret** the result of the print operation. A return value of ‘GTK_PRINT_OPERATION_RESULT_APPLY’ indicates that the printing was completed successfully. In this case, it is a good idea to obtain the used print settings with `gtk-print-operation-get-print-settings` and store them for reuse with the next print operation. A value of ‘GTK_PRINT_OPERATION_RESULT_IN_PROGRESS’ means the operation is running asynchronously, and will emit the ::done signal when done.

Since 2.10

**gtk-print-operation-cancel** *(self `<gtk-print-operation>*)* [Function]
**cancel** [Method]
Cancels a running print operation. This function may be called from a begin-print, paginate or draw-page signal handler to stop the currently running print operation.

- **op** a `<gtk-print-operation>`

Since 2.10

**gtk-print-operation-get-status** *(self `<gtk-print-operation>*)* ⇒ *(ret `<gtk-print-status>*)* [Function]
**get-status** [Method]
Returns the status of the print operation. Also see `gtk-print-operation-get-status-string`.

- **op** a `<gtk-print-operation>`
Chapter 109: GtkPrintOperation

\[ ret \] the status of the print operation

Since 2.10

\textbf{gtk-print-operation-is-finished} \( (self \ <\text{gtk-print-operation}> \) \) \quad [Function]
\[ \Rightarrow (ret \ \text{bool}) \]
\textbf{is-finished} \quad [Method]
A convenience function to find out if the print operation is finished, either successfully ('GTK_PRINT_STATUS_FINISHED') or unsuccessfully ('GTK_PRINT_STATUS_FINISHED_ABORTED').

Note: when you enable print status tracking the print operation can be in a non-finished state even after done has been called, as the operation status then tracks the print job status on the printer.

\( op \) \quad a \ <\text{gtk-print-operation}> \\
\( ret \) \quad 't', if the print operation is finished.

Since 2.10

\textbf{gtk-print-operation-get-error} \( (self \ <\text{gtk-print-operation}> \) \) \quad [Function]
\textbf{get-error} \quad [Method]
Call this when the result of a print operation is 'GTK_PRINT_OPERATION_RESULT_ERROR', either as returned by \textbf{gtk-print-operation-run}, or in the done signal handler. The returned \text{g-error} will contain more details on what went wrong.

\( op \) \quad a \ <\text{gtk-print-operation}> \\
\( error \) \quad return location for the error

Since 2.10

\textbf{gtk-print-run-page-setup-dialog} \( (parent \ <\text{gtk-window}> \) \) \quad [Function]
\[ (page\_setup \ <\text{gtk-page-setup}> \) \ (settings \ <\text{gtk-print-settings}> \) \]
\[ \Rightarrow (ret \ <\text{gtk-page-setup}> \) \]
Runs a page setup dialog, letting the user modify the values from \text{page-setup}. If the user cancels the dialog, the returned \text{gtk-page-setup} is identical to the passed in \text{page-setup}, otherwise it contains the modifications done in the dialog.

Note that this function may use a recursive mainloop to show the page setup dialog. See \textbf{gtk-print-run-page-setup-dialog-async} if this is a problem.

\( parent \) \quad transient parent, or 'f' \\
\( page\_setup \) \quad an existing \text{gtk-page-setup}, or 'f' \\
\( settings \) \quad a \ <\text{gtk-print-settings}> \\
\( ret \) \quad a new \text{gtk-page-setup}
Chapter 110: GtkPrintContext

Encapsulates context for drawing pages

### 110.1 Overview

A GtkPrintContext encapsulates context information that is required when drawing pages for printing, such as the cairo context and important parameters like page size and resolution. It also lets you easily create `<pango-layout>` and `<pango-context>` objects that match the font metrics of the cairo surface.

GtkPrintContext objects get passed to the `::begin-print`, `::end-print`, `::request-page-setup` and `::draw-page` signals on the `<gtk-print-operation>`.

```c
static void
draw_page (GtkPrintOperation *operation,
            GtkPrintContext *context,
            int page_nr)
{
    cairo_t *cr;
    PangoLayout *layout;
    PangoFontDescription *desc;

    cr = gtk_print_context_get_cairo_context (context);

    /* Draw a red rectangle, as wide as the paper (inside the margins) */
    cairo_set_source_rgb (cr, 1.0, 0, 0);
    cairo_rectangle (cr, 0, 0, gtk_print_context_get_width (context), 50);
    cairo_fill (cr);

    /* Draw some lines */
    cairo_move_to (cr, 20, 10);
    cairo_line_to (cr, 40, 20);
    cairo_arc (cr, 60, 60, 20, 0, M_PI);
    cairo_line_to (cr, 80, 20);
    cairo_set_source_rgb (cr, 0, 0, 0);
    cairo_set_line_width (cr, 5);
    cairo_set_line_cap (cr, CAIRO_LINE_CAP_ROUND);
    cairo_set_line_join (cr, CAIRO_LINE_JOIN_ROUND);
    cairo_stroke (cr);

    /* Draw some text */
    layout = gtk_print_context_create_layout (context);
    pango_layout_set_text (layout, "Hello World! Printing is easy", -1);
    desc = pango_font_description_from_string ("sans 28");
```
pango_layout_set_font_description (layout, desc);
pango_font_description_free (desc);

cairo_move_to (cr, 30, 20);
pango_cairo_layout_path (cr, layout);

/* Font Outline */
cairo_set_source_rgb (cr, 0.93, 1.0, 0.47);
cairo_set_line_width (cr, 0.5);
cairo_stroke_preserve (cr);

/* Font Fill */
cairo_set_source_rgb (cr, 0, 0.0, 1.0);
cairo_fill (cr);

g_object_unref (layout);
}

Printing support was added in GTK+ 2.10.

110.2 Usage

<gtk-print-context> [Class]
  Derives from <gobject>.
  This class defines no direct slots.

gtk-print-context-get-cairo-context [Function]
  (self <gtk-print-context>) ⇒ (ret cairo-t)
get-cairo-context [Method]
  Obtains the cairo context that is associated with the <gtk-print-context>.
  context a <gtk-print-context>
  ret the cairo context of context
  Since 2.10

gtk-print-context-set-cairo-context [Function]
  (self <gtk-print-context>) (cr cairo-t) (dpi-x double) (dpi-y double)
set-cairo-context [Method]
  Sets a new cairo context on a print context.
  This function is intended to be used when implementing an internal print preview, it
  is not needed for printing, since GTK+ itself creates a suitable cairo context in that
  case.
  context a <gtk-print-context>
  cr the cairo context
  dpi-x the horizontal resolution to use with cr
  dpi-y the vertical resolution to use with cr
  Since 2.10
Chapter 110: GtkPrintContext

```python
get-page-setup (self <gtk-print-context>) ⇒ (ret <gtk-page-setup>)
```

[Method]
Obtains the `<gtk-page-setup>` that determines the page dimensions of the `<gtk-print-context>`.

- `context` a `<gtk-print-context>`
- `ret` the page setup of `context`

Since 2.10

```python
gtk-print-context-get-width (self <gtk-print-context>) ⇒ (ret double)
```

[Method]
Obtains the width of the `<gtk-print-context>`, in pixels.

- `context` a `<gtk-print-context>`
- `ret` the width of `context`

Since 2.10

```python
gtk-print-context-get-height (self <gtk-print-context>) ⇒ (ret double)
```

[Method]
Obtains the height of the `<gtk-print-context>`, in pixels.

- `context` a `<gtk-print-context>`
- `ret` the height of `context`

Since 2.10

```python
gtk-print-context-get-dpi-x (self <gtk-print-context>) ⇒ (ret double)
```

[Method]
Obtains the horizontal resolution of the `<gtk-print-context>`, in dots per inch.

- `context` a `<gtk-print-context>`
- `ret` the horizontal resolution of `context`

Since 2.10

```python
gtk-print-context-get-dpi-y (self <gtk-print-context>) ⇒ (ret double)
```

[Method]
Obtains the vertical resolution of the `<gtk-print-context>`, in dots per inch.

- `context` a `<gtk-print-context>`
- `ret` the vertical resolution of `context`

Since 2.10
gtk-print-context-get-pango-fontmap    [Function]
   \( (self \textless \text{gtk-print-context}\textgreater) \Rightarrow (\text{ret} \textless \text{pango-font-map}\textgreater) \)
get-pango-fontmap          [Method]
   Returns a \textless \text{pango-font-map}\textgreater that is suitable for use with the \textless \text{gtk-print-context}\textgreater.
   
   context   a \textless \text{gtk-print-context}\textgreater
   ret       the font map of \textit{context}

Since 2.10
111 GtkPrintSettings

Stores print settings

111.1 Overview

A GtkPrintSettings object represents the settings of a print dialog in a system-independent way. The main use for this object is that once you’ve printed you can get a settings object that represents the settings the user chose, and the next time you print you can pass that object in so that the user doesn’t have to re-set all his settings.

It’s also possible to enumerate the settings so that you can easily save the settings for the next time your app runs, or even store them in a document. The predefined keys try to use shared values as much as possible so that moving such a document between systems still works.

Printing support was added in GTK+ 2.10.

111.2 Usage

<gtk-print-settings>  
[Class]

Derives from <gobject>.  
This class defines no direct slots.

gtk-print-settings-new ⇒ (ret <gtk-print-settings>)  
[Function]

Creates a new <gtk-print-settings> object.

ret           a new <gtk-print-settings> object
Since 2.10

gtk-print-settings-has-key (self <gtk-print-settings>) (key mchars) ⇒ (ret bool)  
[Function]

has-key  
[Method]

Returns ‘#t’, if a value is associated with key.

settings     a <gtk-print-settings>
key          a key
ret           ‘#t’, if key has a value
Since 2.10

gtk-print-settings-get (self <gtk-print-settings>) (key mchars) ⇒ (ret mchars)  
[Function]

get  
[Method]

Looks up the string value associated with key.

settings     a <gtk-print-settings>
key          a key
ret           the string value for key
Since 2.10
**gtk-print-settings-set** (*self* <gtk-print-settings>) (*key* mchars)  
(*value* mchars)  
[Function]

**set**  
Associates *value* with *key*.

*settings*  
a <gtk-print-settings>

*key*  
a key

*value*  
a string value, or ‘#f’

Since 2.10

**gtk-print-settings-unset** (*self* <gtk-print-settings>)  
(*key* mchars)  
[Function]

**unset**  
Removes any value associated with *key*. This has the same effect as setting the value to ‘#f’.

*settings*  
a <gtk-print-settings>

*key*  
a key

Since 2.10

**gtk-print-settings-get-bool** (*self* <gtk-print-settings>)  
(*key* mchars)  
⇒ (*ret* bool)  
[Function]

**get-bool**  
Returns the boolean represented by the value that is associated with *key*.

The string "true" represents ‘#t’, any other string ‘#f’.

*settings*  
a <gtk-print-settings>

*key*  
a key

*ret*  
‘#t’, if *key* maps to a true value.

Since 2.10

**gtk-print-settings-set-bool** (*self* <gtk-print-settings>)  
(*key* mchars) (*value* bool)  
[Function]

**set-bool**  
Sets *key* to a boolean value.

*settings*  
a <gtk-print-settings>

*key*  
a key

*value*  
a boolean

Since 2.10

**gtk-print-settings-get-double** (*self* <gtk-print-settings>)  
(*key* mchars)  
⇒ (*ret* double)  
[Function]

**get-double**  
Returns the double value associated with *key*, or 0.
settings  a <gtk-print-settings>
key      a key
ret      the double value of key

Since 2.10

**gtk-print-settings-set-double** (self <gtk-print-settings>)  [Function]

(key mchars) (value double)

**set-double**  [Method]
Sets key to a double value.

settings  a <gtk-print-settings>
key      a key
value    a double value

Since 2.10

**gtk-print-settings-get-length** (self <gtk-print-settings>)  [Function]

(key mchars) (unit <gtk-unit>) ⇒ (ret double)

**get-length**  [Method]
Returns the value associated with key, interpreted as a length. The returned value is converted to units.

settings  a <gtk-print-settings>
key      a key
unit     the unit of the return value
ret      the length value of key, converted to unit

Since 2.10

**gtk-print-settings-set-length** (self <gtk-print-settings>)  [Function]

(key mchars) (value double) (unit <gtk-unit>)

**set-length**  [Method]
Associates a length in units of unit with key.

settings  a <gtk-print-settings>
key      a key
value    a length
unit     the unit of length

Since 2.10

**gtk-print-settings-get-int** (self <gtk-print-settings>)  [Function]

(key mchars) ⇒ (ret int)

**get-int**  [Method]
Returns the integer value of key, or 0.

settings  a <gtk-print-settings>
key a key
ret the integer value of key

Since 2.10

gtk-print-settings-set-int (self <gtk-print-settings>)
  (key mchars) (value int) [Function]

set-int [Method]
  Sets key to an integer value.
  settings a <gtk-print-settings>
  key a key
  value an integer

Since 2.10

gtk-print-settings-get-printer (self <gtk-print-settings>) ⇒ (ret mchars) [Function]

get-printer [Method]
  Convenience function to obtain the value of ‘GTK_PRINT_SETTINGS_PRINTER’.
  settings a <gtk-print-settings>
  ret the printer name

Since 2.10

gtk-print-settings-set-printer (self <gtk-print-settings>)
  (printer mchars) [Function]

set-printer [Method]
  Convenience function to set ‘GTK_PRINT_SETTINGS_PRINTER’ to printer.
  settings a <gtk-print-settings>
  printer the printer name

Since 2.10

gtk-print-settings-get-orientation (self <gtk-print-settings>) ⇒ (ret <gtk-page-orientation>) [Function]

get-orientation [Method]
  Get the value of ‘GTK_PRINT_SETTINGS_ORIENTATION’, converted to a <gtk-page-orientation>.
  settings a <gtk-print-settings>
  ret the orientation

Since 2.10

gtk-print-settings-set-orientation (self <gtk-print-settings>) (orientation <gtk-page-orientation>) [Function]

set-orientation [Method]
  Sets the value of ‘GTK_PRINT_SETTINGS_ORIENTATION’.
Chapter 111: GtkPrintSettings

settings  a `<gtk-print-settings>`

orientation  a page orientation

Since 2.10

gtk-print-settings-get-paper-size (self `<gtk-print-settings>`)  [Function]  
⇒ (ret `<gtk-paper-size>`)  

get-paper-size  [Method]  
Gets the value of `GTK_PRINT_SETTINGS_PAPER_FORMAT`, converted to a `<gtk-paper-size>`.  
settings  a `<gtk-print-settings>`  
ret  the paper size  

Since 2.10

gtk-print-settings-set-paper-size (self `<gtk-print-settings>`)  (paper-size `<gtk-paper-size>`)  [Function]  
set-paper-size  [Method]  
Sets the value of `GTK_PRINT_SETTINGS_PAPER_FORMAT`, `GTK_PRINT_SETTINGS_PAPER_WIDTH`, and `GTK_PRINT_SETTINGS_PAPER_HEIGHT`.  
settings  a `<gtk-print-settings>`  
paper-size  a paper size  

Since 2.10

gtk-print-settings-get-paper-width  (self `<gtk-print-settings>`) (unit `<gtk-unit>`) ⇒ (ret double)  
get-paper-width  [Function]  
Gets the value of `GTK_PRINT_SETTINGS_PAPER_WIDTH`, converted to `unit`.  
settings  a `<gtk-print-settings>`  
unit  the unit for the return value  
ret  the paper width, in units of `unit`  

Since 2.10

gtk-print-settings-set-paper-width  (self `<gtk-print-settings>`) (width double) (unit `<gtk-unit>`)  
set-paper-width  [Function]  
Sets the value of `GTK_PRINT_SETTINGS_PAPER_WIDTH`.  
settings  a `<gtk-print-settings>`  
width  the paper width  
unit  the units of `width`  

Since 2.10
Chapter 111: GtkPrintSettings

**gtk-print-settings-get-paper-height**

```
self <gtk-print-settings> (unit <gtk-unit>) ⇒ (ret double)
```

**get-paper-height**

Gets the value of ‘GTK_PRINT_SETTINGS_PAPER_HEIGHT’, converted to unit.

- `settings`: a `<gtk-print-settings>`
- `unit`: the unit for the return value
- `ret`: the paper height, in units of `unit`

Since 2.10

**gtk-print-settings-set-paper-height**

```
self <gtk-print-settings> (height double) (unit <gtk-unit>)
```

**set-paper-height**

Sets the value of ‘GTK_PRINT_SETTINGS_PAPER_HEIGHT’.

- `settings`: a `<gtk-print-settings>`
- `height`: the paper height
- `unit`: the units of `height`

Since 2.10

**gtk-print-settings-get-use-color**

```
self <gtk-print-settings> ⇒ (ret bool)
```

**get-use-color**

Gets the value of ‘GTK_PRINT_SETTINGS_USE_COLOR’.

- `settings`: a `<gtk-print-settings>`
- `ret`: whether to use color

Since 2.10

**gtk-print-settings-set-use-color**

```
self <gtk-print-settings> (use_color bool)
```

**set-use-color**

Sets the value of ‘GTK_PRINT_SETTINGS_USE_COLOR’.

- `settings`: a `<gtk-print-settings>`
- `use-color`: whether to use color

Since 2.10

**gtk-print-settings-get-collate**

```
self <gtk-print-settings> ⇒ (ret bool)
```

**get-collate**

Gets the value of ‘GTK_PRINT_SETTINGS_COLLATE’.

- `settings`: a `<gtk-print-settings>`
- `ret`: whether to collate the printed pages

Since 2.10
Chapter 111: GtkPrintSettings

```c
gtk-print-settings-set-collate (self <gtk-print-settings>) (collate bool)
set-collate
Sets the value of `GTK_PRINT_SETTINGS_COLLATE`.

settings  a <gtk-print-settings>
collate  whether to collate the output

Since 2.10
```

```c
gtk-print-settings-get-reverse (self <gtk-print-settings>) ⇒ (ret bool)
get-reverse
Gets the value of `GTK_PRINT_SETTINGS_REVERSE`.

settings  a <gtk-print-settings>
ret  whether to reverse the order of the printed pages

Since 2.10
```

```c
gtk-print-settings-set-reverse (self <gtk-print-settings>) (reverse bool)
set-reverse
Sets the value of `GTK_PRINT_SETTINGS_REVERSE`.

settings  a <gtk-print-settings>
reverse  whether to reverse the output

Since 2.10
```

```c
gtk-print-settings-get-duplex (self <gtk-print-settings>) ⇒ (ret <gtk-print-duplex>)
get-duplex
Gets the value of `GTK_PRINT_SETTINGS_DUPLEX`.

settings  a <gtk-print-settings>
ret  whether to print the output in duplex.

Since 2.10
```

```c
gtk-print-settings-set-duplex (self <gtk-print-settings>) (duplex <gtk-print-duplex>)
set-duplex
Sets the value of `GTK_PRINT_SETTINGS_DUPLEX`.

settings  a <gtk-print-settings>
duplex  a <gtk-print-duplex> value

Since 2.10
```
gtk-print-settings-get-quality (self <gtk-print-settings>) ⇒ (ret <gtk-print-quality>)

**get-quality**

Gets the value of 'GTK_PRINT_SETTINGS_QUALITY'.

- **settings** a <gtk-print-settings>
- **ret** the print quality

Since 2.10

gtk-print-settings-set-quality (self <gtk-print-settings>)

**(quality <gtk-print-quality>)**

**set-quality**

Sets the value of 'GTK_PRINT_SETTINGS_QUALITY'.

- **settings** a <gtk-print-settings>
- **quality** a <gtk-print-quality> value

Since 2.10

gtk-print-settings-get-n-copies (self <gtk-print-settings>) ⇒ (ret int)

**get-n-copies**

Gets the value of 'GTK_PRINT_SETTINGS_N_COPIES'.

- **settings** a <gtk-print-settings>
- **ret** the number of copies to print

Since 2.10

gtk-print-settings-set-n-copies (self <gtk-print-settings>)

**(num-copies int)**

**set-n-copies**

Sets the value of 'GTK_PRINT_SETTINGS_N_COPIES'.

- **settings** a <gtk-print-settings>
- **num-copies** the number of copies

Since 2.10

gtk-print-settings-get-number-up (self <gtk-print-settings>) ⇒ (ret int)

**get-number-up**

Gets the value of 'GTK_PRINT_SETTINGS_NUMBER_UP'.

- **settings** a <gtk-print-settings>
- **ret** the number of pages per sheet

Since 2.10
gtk-print-settings-set-number-up (self <gtk-print-settings>) [Function]

( number-up int )

set-number-up [Method]
Sets the value of 'GTK_PRINT_SETTINGS_NUMBER_UP'.

settings a <gtk-print-settings>
number-up the number of pages per sheet

Since 2.10

gtk-print-settings-get-resolution (self <gtk-print-settings>) [Function]
⇒ ( ret int )

get-resolution [Method]
Gets the value of 'GTK_PRINT_SETTINGS_RESOLUTION'.

settings a <gtk-print-settings>
ret the resolution in dpi

Since 2.10

gtk-print-settings-set-resolution (self <gtk-print-settings>) [Function]

(resolution int)

set-resolution [Method]
Sets the value of 'GTK_PRINT_SETTINGS_RESOLUTION'.

settings a <gtk-print-settings>
resolution the resolution in dpi

Since 2.10

gtk-print-settings-get-scale (self <gtk-print-settings>) [Function]
⇒ ( ret double )

get-scale [Method]
Gets the value of 'GTK_PRINT_SETTINGS_SCALE'.

settings a <gtk-print-settings>
ret the scale in percent

Since 2.10

gtk-print-settings-set-scale (self <gtk-print-settings>) [Function]

(scale double)

set-scale [Method]
Sets the value of 'GTK_PRINT_SETTINGS_SCALE'.

settings a <gtk-print-settings>
scale the scale in percent

Since 2.10
Chapter 111: GtkPrintSettings

```haskell
gtk-print-settings-get-page-set (self <gtk-print-settings>) ⇒ (ret <gtk-page-set>)

get-page-set
Gets the value of ‘GTK_PRINT_SETTINGS_PAGE_SET’.

settings a <gtk-print-settings>
ret the set of pages to print

Since 2.10
```

```haskell
gtk-print-settings-set-page-set (self <gtk-print-settings>)
(page_set <gtk-page-set>)

set-page-set
Sets the value of ‘GTK_PRINT_SETTINGS_PAGE_SET’.

settings a <gtk-print-settings>
page-set a <gtk-page-set> value

Since 2.10
```

```haskell
gtk-print-settings-get-media-type (self <gtk-print-settings>) ⇒ (ret mchars)

get-media-type
Gets the value of ‘GTK_PRINT_SETTINGS_MEDIA_TYPE’.
The set of media types is defined in PWG 5101.1-2002 PWG.

settings a <gtk-print-settings>
ret the media type

Since 2.10
```

```haskell
gtk-print-settings-set-media-type (self <gtk-print-settings>)
(media_type mchars)

set-media-type
Sets the value of ‘GTK_PRINT_SETTINGS_MEDIA_TYPE’.
The set of media types is defined in PWG 5101.1-2002 PWG.

settings a <gtk-print-settings>
media-type the media type

Since 2.10
```

```haskell
gtk-print-settings-get-dither (self <gtk-print-settings>) ⇒ (ret mchars)

get-dither
Gets the value of ‘GTK_PRINT_SETTINGS_DITHER’.

settings a <gtk-print-settings>
ret the dithering that is used

Since 2.10
```
gtk-print-settings-set-dither (self <gtk-print-settings>)
(dither mchars)

set-dither
Sets the value of ‘GTK_PRINT_SETTINGS_DITHER’.

settings a <gtk-print-settings>
dither the dithering that is used

Since 2.10

gtk-print-settings-get-finishings (self <gtk-print-settings>)
⇒ (ret mchars)

get-finishings
Gets the value of ‘GTK_PRINT_SETTINGS_FINISHINGS’.

settings a <gtk-print-settings>
ret the finishings

Since 2.10

gtk-print-settings-set-finishings (self <gtk-print-settings>)
(finishings mchars)

set-finishings
Sets the value of ‘GTK_PRINT_SETTINGS_FINISHINGS’.

settings a <gtk-print-settings>
finishings the finishings

Since 2.10

gtk-print-settings-get-output-bin (self <gtk-print-settings>)
⇒ (ret mchars)

get-output-bin
Gets the value of ‘GTK_PRINT_SETTINGS_OUTPUT_BIN’.

settings a <gtk-print-settings>
ret the output bin

Since 2.10

gtk-print-settings-set-output-bin (self <gtk-print-settings>)
(output_bin mchars)

set-output-bin
Sets the value of ‘GTK_PRINT_SETTINGS_OUTPUT_BIN’.

settings a <gtk-print-settings>
output-bin the output bin

Since 2.10
112 GtkPageSetup

Stores page setup information

112.1 Overview

A GtkPageSetup object stores the page size, orientation and margins. The idea is that you can get one of these from the page setup dialog and then pass it to the <gtk-print-operation> when printing. The benefit of splitting this out of the <gtk-print-settings> is that these affect the actual layout of the page, and thus need to be set long before user prints.

The margins specified in this object are the "print margins", i.e. the parts of the page that the printer cannot print on. These are different from the layout margins that a word processor uses; they are typically used to determine the minimal size for the layout margins.

To obtain a <gtk-page-setup> use gtk-page-setup-new to get the defaults, or use gtk-print-run-page-setup-dialog to show the page setup dialog and receive the resulting page setup.

```c
static GtkPrintSettings *settings = NULL;
static GtkPageSetup *page_setup = NULL;

static void
do_page_setup (void)
{
    GtkPageSetup *new_page_setup;

    if (settings == NULL)
        settings = gtk_print_settings_new ();

    new_page_setup = gtk_print_run_page_setup_dialog (GTK_WINDOW (main_window),
                                                        page_setup, settings);

    if (page_setup)
        g_object_unref (page_setup);

    page_setup = new_page_setup;
}

Printing support was added in GTK+ 2.10.

112.2 Usage

**<gtk-page-setup>**

[Class]

Derives from <gobject>.

This class defines no direct slots.

**gtk-page-setup-new ⇒ (ret <gtk-page-setup>)**

[Function]

Creates a new <gtk-page-setup>. 

Chapter 112: GtkPageSetup

ret a new <gtk-page-setup>.

Since 2.10

```c
gtk-page-setup-get-orientation (self <gtk-page-setup>) ⇒ (ret <gtk-page-orientation>)
get-orientation

Gets the page orientation of the <gtk-page-setup>.

setup a <gtk-page-setup>
ret the page orientation
```

Since 2.10

```c
gtk-page-setup-set-orientation (self <gtk-page-setup>) (orientation <gtk-page-orientation>)
set-orientation

Sets the page orientation of the <gtk-page-setup>.

setup a <gtk-page-setup>
orientation a <gtk-page-orientation> value
```

Since 2.10

```c
gtk-page-setup-get-paper-size (self <gtk-page-setup>) ⇒ (ret <gtk-paper-size>)
get-paper-size

Gets the paper size of the <gtk-page-setup>.

setup a <gtk-page-setup>
ret the paper size
```

Since 2.10

```c
gtk-page-setup-set-paper-size (self <gtk-page-setup>) (size <gtk-paper-size>)
set-paper-size

Sets the paper size of the <gtk-page-setup> without changing the margins. See

setup a <gtk-page-setup>
size a <gtk-paper-size>
```

Since 2.10

```c
gtk-page-setup-get-top-margin (self <gtk-page-setup>) (unit <gtk-unit>) ⇒ (ret double)
get-top-margin

Gets the top margin in units of unit.

setup a <gtk-page-setup>
```

Since 2.10
**Chapter 112: GtkPageSetup**

Since 2.10

**gtk-page-setup-set-top-margin** *(self <gtk-page-setup>)*

* (margin double) (unit <gtk-unit>)

**set-top-margin**

Sets the top margin of the `<gtk-page-setup>`.

* setup a `<gtk-page-setup>`
* margin the new top margin in units of *unit*
* unit the units for *margin*

Since 2.10

**gtk-page-setup-get-bottom-margin** *(self <gtk-page-setup>)*

* (unit <gtk-unit> ⇒ (ret double))

**get-bottom-margin**

Gets the bottom margin in units of *unit*.

* setup a `<gtk-page-setup>`
* unit the unit for the return value
* ret the bottom margin

Since 2.10

**gtk-page-setup-set-bottom-margin** *(self <gtk-page-setup>)*

* (margin double) (unit <gtk-unit>)

**set-bottom-margin**

Sets the bottom margin of the `<gtk-page-setup>`.

* setup a `<gtk-page-setup>`
* margin the new bottom margin in units of *unit*
* unit the units for *margin*

Since 2.10

**gtk-page-setup-get-left-margin** *(self <gtk-page-setup>)*

* (unit <gtk-unit> ⇒ (ret double))

**get-left-margin**

Gets the left margin in units of *unit*.

* setup a `<gtk-page-setup>`
* unit the unit for the return value
* ret the left margin

Since 2.10

*unit* the unit for the return value

*ret* the top margin
Chapter 112: GtkPageSetup

```plaintext
gtk-page-setup-set-left-margin (self <gtk-page-setup>)
  (margin double) (unit <gtk-unit>)
set-left-margin
Sets the left margin of the <gtk-page-setup>.
  setup      a <gtk-page-setup>
  margin     the new left margin in units of unit
  unit       the units for margin
Since 2.10

gtk-page-setup-get-right-margin (self <gtk-page-setup>)
  (unit <gtk-unit>) ⇒ (ret double)
get-right-margin
Gets the right margin in units of unit.
  setup      a <gtk-page-setup>
  unit       the unit for the return value
  ret        the right margin
Since 2.10

gtk-page-setup-set-right-margin (self <gtk-page-setup>)
  (margin double) (unit <gtk-unit>)
set-right-margin
Sets the right margin of the <gtk-page-setup>.
  setup      a <gtk-page-setup>
  margin     the new right margin in units of unit
  unit       the units for margin
Since 2.10

gtk-page-setup-get-paper-width (self <gtk-page-setup>)
  (unit <gtk-unit>) ⇒ (ret double)
get-paper-width
Returns the paper width in units of unit.
Note that this function takes orientation, but not margins into consideration. See
gtk-page-setup-get-page-width.
  setup      a <gtk-page-setup>
  unit       the unit for the return value
  ret        the paper width.
Since 2.10
```
gtk-page-setup-get-paper-height (self <gtk-page-setup>) [Function]
  (unit <gtk-unit>) ⇒ (ret double)

get-paper-height [Method]
  Returns the paper height in units of unit.
  Note that this function takes orientation, but not margins into consideration. See gtk-page-setup-get-paper-height.

  setup a <gtk-page-setup>
  unit the unit for the return value
  ret the paper height.

  Since 2.10

gtk-page-setup-get-page-width (self <gtk-page-setup>) [Function]
  (unit <gtk-unit>) ⇒ (ret double)

get-page-width [Method]
  Returns the page width in units of unit.
  Note that this function takes orientation and margins into consideration. See gtk-page-setup-get-paper-width.

  setup a <gtk-page-setup>
  unit the unit for the return value
  ret the page width.

  Since 2.10

gtk-page-setup-get-page-height (self <gtk-page-setup>) [Function]
  (unit <gtk-unit>) ⇒ (ret double)

get-page-height [Method]
  Returns the page height in units of unit.
  Note that this function takes orientation and margins into consideration. See gtk-page-setup-get-paper-height.

  setup a <gtk-page-setup>
  unit the unit for the return value
  ret the page height.

  Since 2.10
Chapter 113: GtkPaperSize

Support for named paper sizes

113.1 Overview

GtkPaperSize handles paper sizes. It uses the standard called "PWG 5101.1-2002 PWG: Standard for Media Standardized Names" to name the paper sizes (and to get the data for the page sizes). In addition to standard paper sizes, GtkPaperSize allows to construct custom paper sizes with arbitrary dimensions.

The <gtk-paper-size> object stores not only the dimensions (width and height) of a paper size and its name, it also provides default print margins.

Printing support has been added in GTK+ 2.10.

113.2 Usage

<gtk-paper-size> [Class]

Dervies from <gboxed>.

This class defines no direct slots.

gtk-paper-size-new (name mchars) ⇒ (ret <gtk-paper-size>) [Function]

Creates a new <gtk-paper-size> object by parsing a PWG 5101.1-2002 PWG paper name.

If name is '#f', the default paper size is returned, see gtk-paper-size-get-default.

name a paper size name, or '#f'

ret a new <gtk-paper-size>, use gtk-paper-size-free to free it

Since 2.10

gtk-paper-size-new-from-ppd (ppd_name mchars) (ppd_display_name mchars) (width double) (height double) ⇒ (ret <gtk-paper-size>) [Function]

Creates a new <gtk-paper-size> object by using PPD information.

If ppd-name is not a recognized PPD paper name, ppd-display-name, width and height are used to construct a custom <gtk-paper-size> object.

ppd-name a PPD paper name

ppd-display-name the corresponding human-readable name

width the paper width, in points

height the paper height in points

ret a new <gtk-paper-size>, use gtk-paper-size-free to free it

Since 2.10
**GtkPaperSize**

**Function**

`gtk-paper-size-new-custom (name mchars) (display_name mchars) (width double) (height double) (unit <gtk-unit>) ⇒ (ret <gtk-paper-size>)`

Creates a new `<gtk-paper-size>` object with the given parameters.

* name: the paper name
* display-name: the human-readable name
* width: the paper width, in units of `unit`
* height: the paper height, in units of `unit`
* unit: the unit for `width` and `height`
* ret: a new `<gtk-paper-size>` object, use `gtk-paper-size-free` to free it

Since 2.10

**Function**

`gtk-paper-size-is-equal (self <gtk-paper-size>) (size2 <gtk-paper-size>) ⇒ (ret bool)`

Compares two `<gtk-paper-size>` objects.

* size1: a `<gtk-paper-size>` object
* size2: another `<gtk-paper-size>` object
* ret: `#t`, if `size1` and `size2` represent the same paper size

Since 2.10

**Function**

`gtk-paper-size-get-name (self <gtk-paper-size>) ⇒ (ret mchars)`

Gets the name of the `<gtk-paper-size>`.

* size: a `<gtk-paper-size>` object
* ret: the name of `size`

Since 2.10

**Function**

`gtk-paper-size-get-display-name (self <gtk-paper-size>) ⇒ (ret mchars)`

Gets the human-readable name of the `<gtk-paper-size>`.

* size: a `<gtk-paper-size>` object
* ret: the human-readable name of `size`

Since 2.10

**Function**

`gtk-paper-size-get-ppd-name (self <gtk-paper-size>) ⇒ (ret mchars)`

Gets the PPD name of the `<gtk-paper-size>`, which may be `#f`.

* size: a `<gtk-paper-size>` object
* ret: the PPD name of `size`

Since 2.10
Chapter 113: GtkPaperSize

`gtk-paper-size-get-width (self <gtk-paper-size>) (unit <gtk-unit>) ⇒ (ret double)`

Gets the paper width of the `gtk-paper-size`, in units of `unit`.

- `size` a `gtk-paper-size` object
- `unit` the unit for the return value
- `ret` the paper width

Since 2.10

`gtk-paper-size-get-height (self <gtk-paper-size>) (unit <gtk-unit>) ⇒ (ret double)`

Gets the paper height of the `gtk-paper-size`, in units of `unit`.

- `size` a `gtk-paper-size` object
- `unit` the unit for the return value
- `ret` the paper height

Since 2.10

`gtk-paper-size-is-custom (self <gtk-paper-size>) ⇒ (ret bool)`

Returns ‘#t’ if `size` is not a standard paper size.

- `size` a `gtk-paper-size` object
- `ret` whether `size` is a custom paper size.

`gtk-paper-size-set-size (self <gtk-paper-size>) (width double) (height double) (unit <gtk-unit>)`  
Changes the dimensions of a `size` to `width x height`.

- `size` a custom `gtk-paper-size` object
- `width` the new width in units of `unit`
- `height` the new height in units of `unit`
- `unit` the unit for `width` and `height`

Since 2.10

`gtk-paper-size-get-default ⇒ (ret mchars)`

Returns the name of the default paper size, which depends on the current locale.

- `ret` the name of the default paper size. The string is owned by GTK+ and should not be modified.

Since 2.10
114 GtkAdjustment

A GtkWidget representing an adjustable bounded value

114.1 Overview

The <gtk-adjustment> object represents a value which has an associated lower and upper bound, together with step and page increments, and a page size. It is used within several GTK+ widgets, including <gtk-spin-button>, <gtk-viewport>, and <gtk-range> (which is a base class for <gtk-hscrollbar>, <gtk-vscrollbar>, <gtk-hscale>, and <gtk-vscale>).

The <gtk-adjustment> object does not update the value itself. Instead it is left up to the owner of the <gtk-adjustment> to control the value.

The owner of the <gtk-adjustment> typically calls the gtk-adjustment-value-changed and gtk-adjustment-changed functions after changing the value and its bounds. This results in the emission of the "value_changed" or "changed" signal respectively.

114.2 Usage

<gtk-adjustment> [Class]

Derives from <gtk-object>.

This class defines the following slots:

value The value of the adjustment
lower The minimum value of the adjustment
upper The maximum value of the adjustment
step-increment The step increment of the adjustment
page-increment The page increment of the adjustment
page-size The page size of the adjustment

changed [Signal on <gtk-adjustment>]

Emitted when one or more of the <gtk-adjustment> fields have been changed, other than the value field.

value-changed [Signal on <gtk-adjustment>]

Emitted when the <gtk-adjustment> value field has been changed.

gtk-adjustment-new (value double) (lower double) (upper double) [Function]

( (step_increment double) (page_increment double) (page_size double) )
⇒ ( ret <gtk-object> )

Creates a new <gtk-adjustment>.

value the initial value.
lower the minimum value.
upper the maximum value.
step-increment the step increment.
page-increment the page increment.
page-size the page size.
ret a new <gtk-adjustment>.

```c
gtk-adjustment-get-value (self <gtk-adjustment>) ⇒ (ret double)
```

get-value [Method]
Gets the current value of the adjustment. See gtk-adjustment-set-value.

```c
adjustment a <gtk-adjustment>
ret The current value of the adjustment.
```

```c
gtk-adjustment-set-value (self <gtk-adjustment>) (value double) [Function]
set-value [Method]
Sets the <gtk-adjustment> value. The value is clamped to lie between 'adjustment->lower' and 'adjustment->upper'.

Note that for adjustments which are used in a <gtk-scrollbar>, the effective range of allowed values goes from 'adjustment->lower' to 'adjustment->upper - adjustment->page_size'.

```c
adjustment a <gtk-adjustment>.
value the new value.
```

```c
gtk-adjustment-clamp-page (self <gtk-adjustment>) (lower double) (upper double) [Function]
clamp-page [Method]
Updates the <gtk-adjustment> value to ensure that the range between lower and upper is in the current page (i.e. between value and value + page-size). If the range is larger than the page size, then only the start of it will be in the current page. A "changed" signal will be emitted if the value is changed.

```c
adjustment a <gtk-adjustment>.
lower the lower value.
upper the upper value.
gtk-adjustment-changed (self <gtk-adjustment>)

changed

Emits a "changed" signal from the <gtk-adjustment>. This is typically called by the owner of the <gtk-adjustment> after it has changed any of the <gtk-adjustment> fields other than the value.

  adjustment
  a <gtk-adjustment>

gtk-adjustment-value-changed (self <gtk-adjustment>)

value-changed

Emits a "value_changed" signal from the <gtk-adjustment>. This is typically called by the owner of the <gtk-adjustment> after it has changed the <gtk-adjustment> value field.

  adjustment
  a <gtk-adjustment>
115 GtkArrow

Displays an arrow

115.1 Overview

GtkArrow should be used to draw simple arrows that need to point in one of the four cardinal directions (up, down, left, or right). The style of the arrow can be one of shadow in, shadow out, etched in, or etched out. Note that these directions and style types may be amended in versions of Gtk to come.

GtkArrow will fill any space allotted to it, but since it is inherited from <gtk-misc>, it can be padded and/or aligned, to fill exactly the space the programmer desires.

Arrows are created with a call to gtk-arrow-new. The direction or style of an arrow can be changed after creation by using gtk-arrow-set.

115.2 Usage

<gtk-arrow> [Class]

Derives from <gtk-misc>.

This class defines the following slots:

arrow-type

The direction the arrow should point

shadow-type

Appearance of the shadow surrounding the arrow

gtk-arrow-new (arrow-type <gtk-arrow-type>)

(\text{shadow-type} <\text{gtk-shadow-type}>) \Rightarrow (\text{ret} <\text{gtk-widget}>)

Creates a new arrow widget.

\begin{itemize}
  \item arrow-type \text{a valid} <\text{gtk-arrow-type}>
  \item shadow-type \text{a valid} <\text{gtk-shadow-type}>
  \item ret \text{the new} <\text{gtk-arrow}> \text{widget.}
\end{itemize}

gtk-arrow-set (self <\text{gtk-arrow}>)(arrow-type <\text{gtk-arrow-type}>)

(\text{shadow-type} <\text{gtk-shadow-type}>)

set [Function]

Sets the direction and style of the <\text{gtk-arrow}>, \text{arrow}.

\begin{itemize}
  \item arrow \text{a widget of type} <\text{gtk-arrow}>
  \item arrow-type \text{a valid} <\text{gtk-arrow-type}>
  \item shadow-type \text{a valid} <\text{gtk-shadow-type}>
\end{itemize}
116 GtkCalendar

Displays a calendar and allows the user to select a date

116.1 Overview

<gtk-calendar> is a widget that displays a calendar, one month at a time. It can be created with gtk-calendar-new.

The month and year currently displayed can be altered with gtk-calendar-select-month. The exact day can be selected from the displayed month using gtk-calendar-select-day.

To place a visual marker on a particular day, use gtk-calendar-mark-day and to remove the marker, gtk-calendar-unmark-day. Alternative, all marks can be cleared with gtk-calendar-clear-marks.

The way in which the calendar itself is displayed can be altered using gtk-calendar-set-display-options.

The selected date can be retrieved from a <gtk-calendar> using gtk-calendar-get-date.

116.2 Usage

<gtk-calendar> [Class]

Derives from <gtk-widget>.

This class defines the following slots:

- **year** The selected year
- **month** The selected month (as a number between 0 and 11)
- **day** The selected day (as a number between 1 and 31, or 0 to unselect the currently selected day)
- **show-heading** If TRUE, a heading is displayed
- **show-day-names** If TRUE, day names are displayed
- **no-month-change** If TRUE, the selected month cannot be changed
- **show-week-numbers** If TRUE, week numbers are displayed

**month-changed** [Signal on <gtk-calendar>]

Emitted when the user clicks a button to change the selected month on a calendar.

**day-selected** [Signal on <gtk-calendar>]

Emitted when the user selects a day.
Chapter 116: GCal 475

[Signal on <gtk-calendar>]
day-selected-double-click

[Signal on <gtk-calendar>]
prev-month

[Signal on <gtk-calendar>]
next-month

[Signal on <gtk-calendar>]
prev-year

[Signal on <gtk-calendar>]
next-year

gtk-calendar-new ⇒ (ret <gtk-widget>)  
Creates a new calendar, with the current date being selected.  
ret a newly <gtk-calendar> widget

gtk-calendar-select-month (self <gtk-calendar>)  
(month unsigned-int) (year unsigned-int) ⇒ (ret bool)  
select-month  
Shifts the calendar to a different month.  
calendar a <gtk-calendar>  
month a month number between 0 and 11.  
year the year the month is in.  
ret ‘#t’, always

gtk-calendar-select-day (self <gtk-calendar>)  
(day unsigned-int)  
select-day  
Selects a day from the current month.  
calendar a <gtk-calendar>.  
day the day number between 1 and 31, or 0 to unselect the currently selected day.

gtk-calendar-mark-day (self <gtk-calendar>) (day unsigned-int)  
mark-day  
Places a visual marker on a particular day.  
calendar a <gtk-calendar>  
day the day number to mark between 1 and 31.  
ret ‘#t’, always

gtk-calendar-unmark-day (self <gtk-calendar>) (day unsigned-int) ⇒ (ret bool)  
unmark-day  
Removes the visual marker from a particular day.  
calendar a <gtk-calendar>.  
day the day number to unmark between 1 and 31.  
ret ‘#t’, always
gtk-calendar-clear-marks (self <gtk-calendar>)

Remove all visual markers.

calendar a <gtk-calendar>

gtk-calendar-set-display-options (self <gtk-calendar>)

(\(flags\) <gtk-calendar-display-options>)

Sets display options (whether to display the heading and the month headings).

calendar a <gtk-calendar>

flags the display options to set

Since 2.4

gtk-calendar-get-date (self <gtk-calendar>)

⇒ (year unsigned-int) (month unsigned-int) (day unsigned-int)

Obtains the selected date from a <gtk-calendar>.

calendar a <gtk-calendar>

year location to store the year number, or ‘#f’

month location to store the month number (between 0 and 11), or ‘#f’

day location to store the day number (between 1 and 31), or ‘#f’

gtk-calendar-freeze (self <gtk-calendar>)

‘gtk_calendar_freeze’ has been deprecated since version 2.8 and should not be used in newly-written code.

Does nothing. Previously locked the display of the calendar until it was thawed with gtk-calendar-thaw.

calendar a <gtk-calendar>

gtk-calendar-thaw (self <gtk-calendar>)

‘gtk_calendar_thaw’ has been deprecated since version 2.8 and should not be used in newly-written code.

Does nothing. Previously defrosted a calendar; all the changes made since the last gtk-calendar-freeze were displayed.

calendar a <gtk-calendar>
117 GtkDrawingArea

A widget for custom user interface elements

117.1 Overview

The `<gtk-drawing-area>` widget is used for creating custom user interface elements. It’s essentially a blank widget; you can draw on `widget->window`. After creating a drawing area, the application may want to connect to:

Mouse and button press signals to respond to input from the user. (Use `gtk-widget-add-events` to enable events you wish to receive.)

The "realize" signal to take any necessary actions when the widget is instantiated on a particular display. (Create GDK resources in response to this signal.)

The "configure_event" signal to take any necessary actions when the widget changes size.

The "expose_event" signal to handle redrawing the contents of the widget.

The following code portion demonstrates using a drawing area to display a circle in the normal widget foreground color. Note that GDK automatically clears the exposed area to the background color before sending the expose event, and that drawing is implicitly clipped to the exposed area.

```c
gboolean expose_event_callback (GtkWidget *widget, GdkEventExpose *event, gpointer data)
{
    gdk_draw_arc (widget->window, widget->style->fg_gc[GTK_WIDGET_STATE (widget)],
                  TRUE,
                  0, 0, widget->allocation.width, widget->allocation.height,
                  0, 64 * 360);
    return TRUE;
}

GtkWidget *drawing_area = gtk_drawing_area_new ();
gtk_widget_set_size_request (drawing_area, 100, 100);
g_signal_connect (G_OBJECT (drawing_area), "expose_event",
                  G_CALLBACK (expose_event_callback), NULL);

Expose events are normally delivered when a drawing area first comes onscreen, or when it’s covered by another window and then uncovered (exposed). You can also force an expose event by adding to the "damage region" of the drawing area’s window; `gtk-widget-queue-draw-area` and `gdk-window-invalidate-rect` are equally good ways to do this. You’ll then get an expose event for the invalid region.

The available routines for drawing are documented on the GDK Drawing Primitives page. See also `gdk-pixbuf-render-to-drawable` for drawing a `<gdk-pixbuf>`.

To receive mouse events on a drawing area, you will need to enable them with `gtk-widget-add-events`. To receive keyboard events, you will need to set the `<gtk-can-focus>`
flag on the drawing area, and should probably draw some user-visible indication that the
drawing area is focused. Use the \texttt{gtk-has-focus} macro in your expose event handler to
decide whether to draw the focus indicator. See \texttt{gtk-paint-focus} for one way to draw
focus.

117.2 Usage

\begin{verbatim}
<gtk-drawing-area> [Class]
  Derives from \texttt{<gtk-widget>}. This class defines no direct slots.

gtk-drawing-area-new ⇒ (ret \texttt{<gtk-widget>}) [Function]
  Creates a new drawing area.
  \texttt{ret} a new \texttt{<gtk-drawing-area>}
\end{verbatim}
Chapter 118: GtkEventBox

A widget used to catch events for widgets which do not have their own window

118.1 Overview

The `<gtk-event-box>` widget is a subclass of `<gtk-bin>` which also has its own window. It is useful since it allows you to catch events for widgets which do not have their own window.

118.2 Usage

```gambas
<gtk-event-box>                      [Class]
  Derives from `<gtk-bin>`.  
  This class defines the following slots:
    visible-window          Whether the event box is visible, as opposed to invisible and only used to trap events.
    above-child            Whether the event-trapping window of the eventbox is above the window of the child widget as opposed to below it.

gtk-event-box-new ⇒ (ret <gtk-widget>)        [Function]
  Creates a new `<gtk-event-box>`. 
  ret          a new `<gtk-event-box>`.

gtk-event-box-set-above-child (self <gtk-event-box>) (above_child bool) [Function]
  set-above-child         Set whether the event box window is positioned above the windows of its child, as opposed to below it. If the window is above, all events inside the event box will go to the event box. If the window is below, events in windows of child widgets will first got to that widget, and then to its parents. 
  The default is to keep the window below the child. 

  event-box       a `<gtk-event-box>`
  above-child    ' #t ' if the event box window is above the windows of its child 

  Since 2.4

gtk-event-box-get-above-child (self `<gtk-event-box>`) [Function]
  ⇒ (ret bool)
  get-above-child      Returns whether the event box window is above or below the windows of its child. 
  See `<gtk-event-box-set-above-child>` for details.

  event-box       a `<gtk-event-box>`
  ret            ' #t ' if the event box window is above the window of its child. 

  Since 2.4
```
Chapter 118: GtkEventBox

**gtk-event-box-set-visible-window** (*self <gtk-event-box>*)  
* (visible_window bool)

**Method**

set-visible-window

Set whether the event box uses a visible or invisible child window. The default is to use visible windows.

In an invisible window event box, the window that that the event box creates is a ‘GDK_INPUT_ONLY’ window, which means that it is invisible and only serves to receive events.

A visible window event box creates a visible (‘GDK_INPUT_OUTPUT’) window that acts as the parent window for all the widgets contained in the event box.

You should generally make your event box invisible if you just want to trap events. Creating a visible window may cause artifacts that are visible to the user, especially if the user is using a theme with gradients or pixmaps.

The main reason to create a non input-only event box is if you want to set the background to a different color or draw on it.

There is one unexpected issue for an invisible event box that has its window below the child. (See gtk-event-box-set-above-child.) Since the input-only window is not an ancestor window of any windows that descendent widgets of the event box create, events on these windows aren’t propagated up by the windowing system, but only by GTK+. The practical effect of this is if an event isn’t in the event mask for the descendant window (see gtk-widget-add-events), it won’t be received by the event box.

This problem doesn’t occur for visible event boxes, because in that case, the event box window is actually the ancestor of the descendant windows, not just at the same place on the screen.

**gtk-event-box-get-visible-window** (*self <gtk-event-box>*)  
⇒ (ret bool)

**Method**

get-visible-window

Returns whether the event box has a visible window. See gtk-event-box-set-visible-window for details.

Since 2.4
119GtkHandleBox

a widget for detachable window portions

119.1 Overview

The <gtk-handle-box> widget allows a portion of a window to be "torn off". It is a bin widget which displays its child and a handle that the user can drag to tear off a separate window (the float window) containing the child widget. A thin ghost is drawn in the original location of the handlebox. By dragging the separate window back to its original location, it can be reattached.

When reattaching, the ghost and float window, must be aligned along one of the edges, the snap edge. This either can be specified by the application programmer explicitly, or GTK+ will pick a reasonable default based on the handle position.

To make detaching and reattaching the handlebox as minimally confusing as possible to the user, it is important to set the snap edge so that the snap edge does not move when the handlebox is deattached. For instance, if the handlebox is packed at the bottom of a VBox, then when the handlebox is detached, the bottom edge of the handlebox’s allocation will remain fixed as the height of the handlebox shrinks, so the snap edge should be set to 'GTK_POS_BOTTOM'.

119.2 Usage

<gtk-handle-box>  [Class]

Derives from <gtk-bin>.

This class defines the following slots:

shadow Deprecated property, use shadow_type instead

shadow-type Appearance of the shadow that surrounds the container

handle-position Position of the handle relative to the child widget

snap-edge Side of the handlebox that’s lined up with the docking point to dock the handlebox

snap-edge-set Whether to use the value from the snap_edge property or a value derived from handle_position

child-attached (arg0 <gtk-widget>)  [Signal on <gtk-handle-box>]

This signal is emitted when the contents of the handlebox are reattached to the main window.

child-detached (arg0 <gtk-widget>)  [Signal on <gtk-handle-box>]

This signal is emitted when the contents of the handlebox are detached from the main window.
Chapter 119: GtkWidget

```c
gtk-handle-box-new ⇒ (ret <gtk-widget>)
Create a new handle box.

ret a new <gtk-handle-box>.
```

```c
gtk-handle-box-set-shadow-type (self <gtk-handle-box>)
(type <gtk-shadow-type>)
set-shadow-type
Sets the type of shadow to be drawn around the border of the handle box.

handle-box a <gtk-handle-box>

type the shadow type.
```

```c
gtk-handle-box-set-handle-position (self <gtk-handle-box>)
(position <gtk-position-type>)
set-handle-position
Sets the side of the handlebox where the handle is drawn.

handle-box a <gtk-handle-box>

position the side of the handlebox where the handle should be drawn.
```

```c
gtk-handle-box-set-snap-edge (self <gtk-handle-box>)
(edge <gtk-position-type>)
set-snap-edge
Sets the snap edge of a handlebox. The snap edge is the edge of the detached child
that must be aligned with the corresponding edge of the "ghost" left behind when the
child was detached to reattach the torn-off window. Usually, the snap edge should be
chosen so that it stays in the same place on the screen when the handlebox is torn
off.

If the snap edge is not set, then an appropriate value will be guessed from the handle
position. If the handle position is 'GTK_POS_RIGHT' or 'GTK_POS_LEFT', then the snap
edge will be 'GTK_POS_TOP', otherwise it will be 'GTK_POS_LEFT'.

handle-box a <gtk-handle-box>

edge the snap edge, or -1 to unset the value; in which case GTK+ will try to
guess an appropriate value in the future.
```

```c
gtk-handle-box-get-handle-position (self <gtk-handle-box>)
⇒ (ret <gtk-position-type>)
get-handle-position
Gets the handle position of the handle box. See gtk-handle-box-set-handle-
position.

handle-box a <gtk-handle-box>

ret the current handle position.
**gtk-handle-box-get-shadow-type (**`self <gtk-handle-box>`**))**  [Function]  
⇒  (**`ret <gtk-shadow-type>`**)  

**get-shadow-type**  
Gets the type of shadow drawn around the handle box. See **gtk-handle-box-set-shadow-type**.

**handle-box**  
a  **<gtk-handle-box>**

**ret**  
the type of shadow currently drawn around the handle box.

**gtk-handle-box-get-snap-edge (**`self <gtk-handle-box>`**)**  [Function]  
⇒  (**`ret <gtk-position-type>`**)  

**get-snap-edge**  
Gets the edge used for determining reattachment of the handle box. See **gtk-handle-box-set-snap-edge**.

**handle-box**  
a  **<gtk-handle-box>**

**ret**  
the edge used for determining reattachment, or (GtkPositionType)-1 if this is determined (as per default) from the handle position.
120 GtkIMContextSimple

An input method context supporting table-based input methods

120.1 Overview

120.2 Usage

```
<gtk-im-context-simple>      [Class]
   Derives from <gtk-im-context>.
   This class defines no direct slots.

gtk-im-context-simple-new ⇒ (ret <gtk-im-context>)  [Function]
   Creates a new <gtk-im-context-simple>.  
   ret a new <gtk-im-context-simple>.

gtk-im-context-simple-add-table (self <gtk-im-context-simple>) (max_seq_len int) (n_seqs int)
   ⇒ (data unsigned-int16)  [Function]
   add-table [Method]
   Adds an additional table to search to the input context. Each row of the table consists
   of max_seq_len key symbols followed by two <guint16> interpreted as the high and
   low words of a <gunicode> value. Tables are searched starting from the last added.
   The table must be sorted in dictionary order on the numeric value of the key symbol
   fields. (Values beyond the length of the sequence should be zero.)

   context-simple
      A <gtk-im-context-simple>

   data the table

   max_seq_len
      Maximum length of a sequence in the table (cannot be greater than <gtk-
      max-compose-len>)

   n-seqs number of sequences in the table
```
121 GtkIMMulticontext

An input method context supporting multiple, loadable input methods

121.1 Overview

121.2 Usage

<stdio>

Derives from <gtk-im-context>.

This class defines no direct slots.

Creates a new <gtk-im-multicontext>.

A new <gtk-im-multicontext>.
122 GtkSizeGroup

Grouping widgets so they request the same size

122.1 Overview

<gtk-size-group> provides a mechanism for grouping a number of widgets together so they all request the same amount of space. This is typically useful when you want a column of widgets to have the same size, but you can’t use a <gtk-table> widget.

In detail, the size requested for each widget in a <gtk-size-group> is the maximum of the sizes that would have been requested for each widget in the size group if they were not in the size group. The mode of the size group (see gtk-size-group-set-mode) determines whether this applies to the horizontal size, the vertical size, or both sizes.

Note that size groups only affect the amount of space requested, not the size that the widgets finally receive. If you want the widgets in a <gtk-size-group> to actually be the same size, you need to pack them in such a way that they get the size they request and not more. For example, if you are packing your widgets into a table, you would not include the ‘GTK_FILL’ flag.

<gtk-size-group> objects are referenced by each widget in the size group, so once you have added all widgets to a <gtk-size-group>, you can drop the initial reference to the size group with g-object-unref. If the widgets in the size group are subsequently destroyed, then they will be removed from the size group and drop their references on the size group; when all widgets have been removed, the size group will be freed.

Widgets can be part of multiple size groups; GTK+ will compute the horizontal size of a widget from the horizontal requisition of all widgets that can be reached from the widget by a chain of size groups of type ‘GTK_SIZE_GROUP_HORIZONTAL’ or ‘GTK_SIZE_GROUP_BOTH’, and the vertical size from the vertical requisition of all widgets that can be reached from the widget by a chain of size groups of type ‘GTK_SIZE_GROUP_VERTICAL’ or ‘GTK_SIZE_GROUP_BOTH’.

122.2 Usage

<gtk-size-group> [Class]

Derives from <gtk-buildable>, <gobject>.

This class defines the following slots:

mode The directions in which the size group affects the requested sizes of its component widgets

ignore-hidden If TRUE, unmapped widgets are ignored when determining the size of the group

gtk-size-group-new (mode <gtk-size-group-mode>) [Function]

⇒ (ret <gtk-size-group>)

Create a new <gtk-size-group>.

mode the mode for the new size group.

ret a newly created <gtk-size-group>
**gtk-size-group-set-mode** *(self <gtk-size-group>)*

**(mode <gtk-size-group-mode>)*

**set-mode**

Sets the `<gtk-size-group-mode>` of the size group. The mode of the size group determines whether the widgets in the size group should all have the same horizontal requisition (`'GTK_SIZE_GROUP_MODE_HORIZONTAL'`) all have the same vertical requisition (`'GTK_SIZE_GROUP_MODE_VERTICAL'`), or should all have the same requisition in both directions (`'GTK_SIZE_GROUP_MODE_BOTH'`).

* size-group a `<gtk-size-group>`
  * mode the mode to set for the size group.

**gtk-size-group-get-mode** *(self <gtk-size-group>)*

⇒ *(ret <gtk-size-group-mode>)*

**get-mode**

Gets the current mode of the size group. See **gtk-size-group-set-mode**.

* size-group a `<gtk-size-group>`
  * ret the current mode of the size group.

**gtk-size-group-set-ignore-hidden** *(self <gtk-size-group>)*

**(ignore_hidden bool)*

**set-ignore-hidden**

Sets whether unmapped widgets should be ignored when calculating the size.

* size-group a `<gtk-size-group>`
  * ignore-hidden whether unmapped widgets should be ignored when calculating the size

Since 2.8

**gtk-size-group-get-ignore-hidden** *(self <gtk-size-group>)*

⇒ *(ret bool)*

**get-ignore-hidden**

Returns if invisible widgets are ignored when calculating the size.

* size-group a `<gtk-size-group>`
  * ret `'#t'` if invisible widgets are ignored.

Since 2.8

**gtk-size-group-add-widget** *(self <gtk-size-group>)*

**(widget <gtk-widget>)*

**add-widget**

Adds a widget to a `<gtk-size-group>`. In the future, the requisition of the widget will be determined as the maximum of its requisition and the requisition of the other widgets in the size group. Whether this applies horizontally, vertically, or in both directions depends on the mode of the size group. See **gtk-size-group-set-mode**.

* size-group a `<gtk-size-group>`
  * widget the `<gtk-widget>` to add
gtk-size-group-remove-widget (self <gtk-size-group>)
    (widget <gtk-widget>)
remove-widget
    Removes a widget from a <gtk-size-group>.
    size-group a <gtk-size-grup>
    widget the <gtk-widget> to remove
Chapter 123: GtkToolTips

Add tips to your widgets

123.1 Overview

Tooltips are the messages that appear next to a widget when the mouse pointer is held over it for a short amount of time. They are especially helpful for adding more verbose descriptions of things such as buttons in a toolbar.

An individual tooltip belongs to a group of tooltips. A group is created with a call to `gtk-tooltips-new`. Every tooltip in the group can then be turned off with a call to `gtk-tooltips-disable` and enabled with `gtk-tooltips-enable`.

The length of time the user must keep the mouse over a widget before the tip is shown, can be altered with `gtk-tooltips-set-delay`. This is set on a 'per group of tooltips' basis.

To assign a tip to a particular `<gtk-widget>`, `gtk-tooltips-set-tip` is used.

Tooltips can only be set on widgets which have their own X window and receive enter and leave events. To check if a widget has its own window use `gtk-widget-no-window`. To add a tooltip to a widget that doesn’t have its own window, place the widget inside a `<gtk-event-box>` and add a tooltip to that instead.

The default appearance of all tooltips in a program is determined by the current GTK+ theme that the user has selected.

Information about the tooltip (if any) associated with an arbitrary widget can be retrieved using `gtk-tooltips-data-get`.

```c
GtkWidget *load_button, *save_button, *hbox;
GtkToolTips *button_bar_tips;

button_bar_tips = gtk_tooltips_new ();

/* Create the buttons and pack them into a GtkHBox */
hbox = gtk_hbox_new (TRUE, 2);
load_button = gtk_button_new_with_label ("Load a file");
gtk_box_pack_start (GTK_BOX (hbox), load_button, TRUE, TRUE, 2);
gtk_widget_show (load_button);

save_button = gtk_button_new_with_label ("Save a file");
gtk_box_pack_start (GTK_BOX (hbox), save_button, TRUE, TRUE, 2);
gtk_widget_show (save_button);

/* Add the tips */
gtk_tooltips_set_tip (GTK_TOOLTIPS (button_bar_tips), load_button, "Load a new document into this window",
"Requests the filename of a document.
This will then be loaded into the current
```
window, replacing the contents of whatever
is already loaded.

```c
gtk_tooltips_set_tip (GTK_TOOLTIPS (button_bar_tips), save_button,
"Saves the current document to a file",
"If you have saved the document previously,
then the new version will be saved over the
old one. Otherwise, you will be prompted for
a filename.");
```

123.2 Usage

```c
<gtk-tooltips>

[Class]
Derives from <gtk-object>.
This class defines no direct slots.

```

```c
gtk-tooltips-new ⇒ (ret <gtk-tooltips>)

[Function]
Creates an empty group of tooltips. This function initialises a <gtk-tooltips>
structure. Without at least one such structure, you cannot add tips to your application.

```

```c
ret a new <gtk-tooltips> group for you to use.

```

```c
gtk-tooltips-enable (self <gtk-tooltips>)

[Function]

enable

[Method]

Allows the user to see your tooltips as they navigate your application.

tooltips a <gtk-tooltips>.

```

```c
gtk-tooltips-disable (self <gtk-tooltips>)

[Function]

disable

[Method]

Causes all tooltips in tooltips to become inactive. Any widgets that have tips associated with that group will no longer display their tips until they are enabled again with gtk-tooltips-enable.

tooltips a <gtk-tooltips>.

```

```c
gtk-tooltips-set-tip (self <gtk-tooltips>)

(set-tip (widget <gtk-widget>) (tip-text mchars) (tip-private mchars)

[Function]

set-tip

[Method]

Adds a tooltip containing the message tip-text to the specified <gtk-widget>.

tooltips a <gtk-tooltips>.

widget the <gtk-widget> you wish to associate the tip with.
tip-text a string containing the tip itself.
tip-private a string of any further information that may be useful if the user gets stuck.

```
gtk-tooltips-force-window (self <gtk-tooltips>)

force-window

Ensures that the window used for displaying the given tooltips is created.
Applications should never have to call this function, since GTK+ takes care of this.

tooltips a <gtk-tool-tips>
124 GtkViewport

An adapter which makes widgets scrollable

124.1 Overview

124.2 Usage

```
<gtk-viewport>  [Class]
   Derives from <gtk-bin>.
   This class defines the following slots:
   hadjustment   The GtkAdjustment that determines the values of the horizontal position
                  for this viewport
   vadjustment   The GtkAdjustment that determines the values of the vertical position
                  for this viewport
   shadow-type   Determines how the shadowed box around the viewport is drawn

set-scroll-adjustments (arg0 <gtk-adjustment>) (arg1 <gtk-adjustment>)  [Signal on <gtk-viewport>]

gtk-viewport-new (hadjustment <gtk-adjustment>) (vadjustment <gtk-adjustment>)  [Function]
   Creates a new <gtk-viewport> with the given adjustments.
   hadjustment   horizontal adjustment.
   vadjustment   vertical adjustment.
   ret           a new <gtk-viewport>.

gtk-viewport-get-hadjustment (self <gtk-viewport>)  [Function]
   ⇒ (ret <gtk-adjustment>)
get-hadjustment   [Method]
   Returns the horizontal adjustment of the viewport.
   viewport   a <gtk-viewport>.
   ret        the horizontal adjustment of viewport.

gtk-viewport-get-vadjustment (self <gtk-viewport>)  [Function]
   ⇒ (ret <gtk-adjustment>)
get-vadjustment   [Method]
   Returns the vertical adjustment of the viewport.
   viewport   a <gtk-viewport>.
   ret        the vertical adjustment of viewport.
```
**gtk-viewport-set-hadjustment** *(self <gtk-viewport>)*  
*(adjustment <gtk-adjustment>)*  

**set-hadjustment**  
Sets the horizontal adjustment of the viewport.

viewport a <gtk-viewport>.

adjustment a <gtk-adjustment>.

**gtk-viewport-set-vadjustment** *(self <gtk-viewport>)*  
*(adjustment <gtk-adjustment>)*  

**set-vadjustment**  
Sets the vertical adjustment of the viewport.

viewport a <gtk-viewport>.

adjustment a <gtk-adjustment>.

**gtk-viewport-set-shadow-type** *(self <gtk-viewport>)*  
*(type <gtk-shadow-type>)*  

**set-shadow-type**  
Sets the shadow type of the viewport.

viewport a <gtk-viewport>.

type the new shadow type.

**gtk-viewport-get-shadow-type** *(self <gtk-viewport>)*  
⇒ (ret <gtk-shadow-type>)*  

**get-shadow-type**  
Gets the shadow type of the <gtk-viewport>. See **gtk-viewport-set-shadow-type**.

viewport a <gtk-viewport>

ret the shadow type
125 GtkAccessible

Accessibility support for widgets

125.1 Overview

125.2 Usage

<gtk-accessible>  [Class]

    Derives from <atk-object>.
    This class defines no direct slots.
126 GtkBin

A container with just one child

126.1 Overview

The `<gtk-bin>` widget is a container with just one child. It is not very useful itself, but it is useful for deriving subclasses, since it provides common code needed for handling a single child widget.

Many GTK+ widgets are subclasses of `<gtk-bin>`, including `<gtk-window>`, `<gtk-button>`, `<gtk-frame>`, `<gtk-handle-box>`, and `<gtk-scrolled-window>`.

126.2 Usage

```
<gtk-bin> [Class]
    Derives from `<gtk-container>`.
    This class defines no direct slots.

gtk-bin-get-child (self <gtk-bin>) ⇒ (ret <gtk-widget>) [Function]
get-child [Method]
    Gets the child of the `<gtk-bin>`, or ‘#f’ if the bin contains no child widget. The returned widget does not have a reference added, so you do not need to unref it.

    bin a <gtk-bin>

    ret pointer to child of the <gtk-bin>
```
127 GtkBox

Base class for box containers

127.1 Overview

GtkBox is an abstract widget which encapsulates functionality for a particular kind of container, one that organizes a variable number of widgets into a rectangular area. GtkBox currently has two derived classes, gtk-hbox and gtk-vbox.

The rectangular area of a GtkBox is organized into either a single row or a single column of child widgets depending upon whether the box is of type gtk-hbox or gtk-vbox, respectively. Thus, all children of a GtkBox are allocated one dimension in common, which is the height of a row, or the width of a column.

GtkBox uses a notion of packing. Packing refers to adding widgets with reference to a particular position in a container. For a GtkBox, there are two reference positions: the start and the end of the box. For a gtk-vbox, the start is defined as the top of the box and the end is defined as the bottom. For a gtk-hbox the start is defined as the left side and the end is defined as the right side.

Use repeated calls to gtk-box-pack-start to pack widgets into a GtkBox from start to end. Use gtk-box-pack-end to add widgets from end to start. You may intersperse these calls and add widgets from both ends of the same GtkBox.

Use gtk-box-pack-start-defaults or gtk-box-pack-end-defaults to pack widgets into a GtkBox if you do not need to specify the , , or attributes of the child to be added.

Because GtkBox is a container, you may also use gtk-container-add to insert widgets into the box, and they will be packed as if with gtk-box-pack-start-defaults. Use gtk-container-remove to remove widgets from the GtkBox.

Use gtk-box-set-homogeneous to specify whether or not all children of the GtkBox are forced to get the same amount of space.

Use gtk-box-set-spacing to determine how much space will be minimally placed between all children in the GtkBox.

Use gtk-box-reorder-child to move a GtkBox child to a different place in the box.

Use gtk-box-set-child-packing to reset the , , and attributes of any GtkBox child. Use gtk-box-query-child-packing to query these fields.

127.2 Usage

<gtk-box> [Class]

Derives from <gtk-container>.

This class defines the following slots:

- **spacing**  The amount of space between children
- **homogeneous**  Whether the children should all be the same size
**gtk-box-pack-start** *(self <gtk-box>) (child <gtk-widget>)*
(expand bool) (fill bool) (padding unsigned-int)

*pack-start*  
Adds *child* to *box*, packed with reference to the start of *box*. The *child* is packed after any other child packed with reference to the start of *box*.

*box* a <gtk-box>.
*child* the <gtk-widget> to be added to *box*.
*expand* ‘#t’ if the new *child* is to be given extra space allocated to *box*. The extra space will be divided evenly between all children of *box* that use this option.
*fill* ‘#t’ if space given to *child* by the *expand* option is actually allocated to *child*, rather than just padding it. This parameter has no effect if *expand* is set to ‘#f’. A child is always allocated the full height of a <gtk-hbox> and the full width of a <gtk-vbox>. This option affects the other dimension.
*padding* extra space in pixels to put between this *child* and its neighbors, over and above the global amount specified by <gtk-box>. If *child* is a widget at one of the reference ends of *box*, then *padding* pixels are also put between *child* and the reference edge of *box*.

**gtk-box-pack-end** *(self <gtk-box>) (child <gtk-widget>)*
(expand bool) (fill bool) (padding unsigned-int)

*pack-end*  
Adds *child* to *box*, packed with reference to the end of *box*. The *child* is packed after (away from end of) any other child packed with reference to the end of *box*.

*box* a <gtk-box>.
*child* the <gtk-widget> to be added to *box*.
*expand* ‘#t’ if the new *child* is to be given extra space allocated to *box*. The extra space will be divided evenly between all children of *box* that use this option.
*fill* ‘#t’ if space given to *child* by the *expand* option is actually allocated to *child*, rather than just padding it. This parameter has no effect if *expand* is set to ‘#f’. A child is always allocated the full height of a <gtk-hbox> and the full width of a <gtk-vbox>. This option affects the other dimension.
*padding* extra space in pixels to put between this *child* and its neighbors, over and above the global amount specified by <gtk-box>. If *child* is a widget at one of the reference ends of *box*, then *padding* pixels are also put between *child* and the reference edge of *box*.

**gtk-box-pack-start-defaults** *(self <gtk-box>)*
(widget <gtk-widget>)

*pack-start-defaults*  
Adds *widget* to *box*, packed with reference to the start of *box*. The child is packed after any other child packed with reference to the start of *box*.
Parameters for how to pack the child widget, `<gtk-box-child>`, are given their default values, ‘#t’, ‘#t’, and 0, respectively.

```c
box a <gtk-box>.
widget the <gtk-widget> to be added to box.
```

```c
gtk-box-pack-end-defaults (self <gtk-box>) (widget <gtk-widget>)
```

`pack-end-defaults`  
Adds widget to box, packed with reference to the end of box. The child is packed after (away from end of) any other child packed with reference to the end of box.

Parameters for how to pack the child widget, `<gtk-box-child>`, are given their default values, ‘#t’, ‘#t’, and 0, respectively.

```c
box a <gtk-box>.
widget the <gtk-widget> to be added to box.
```

```c
gtk-box-get-homogeneous (self <gtk-box>) ⇒ (ret bool)
```

`get-homogeneous`  
Returns whether the box is homogeneous (all children are the same size). See `gtk-box-set-homogeneous`.

```c
box a <gtk-box>
ret ‘#t’ if the box is homogeneous.
```

```c
gtk-box-set-homogeneous (self <gtk-box>) (homogeneous bool)
```

`set-homogeneous`  
Sets the whether or not all children of box are given equal space in the box.

```c
box a <gtk-box>.
homogeneous a boolean value, ‘#t’ to create equal allotments, ‘#f’ for variable allotments.
```

```c
gtk-box-get-spacing (self <gtk-box>) ⇒ (ret int)
```

`get-spacing`  
Gets the value set by `gtk-box-set-spacing`.

```c
box a <gtk-box>
ret spacing between children
```

```c
gtk-box-set-spacing (self <gtk-box>) (spacing int)
```

`set-spacing`  
Sets the number of pixels to place between children of box.

```c
box a <gtk-box>.
 spacing the number of pixels to put between children.
```
Chapter 127: GtkBox

gtk-box-reorder-child (self <gtk-box>) (child <gtk-widget>) (position int)

reorder-child

Moves child to a new position in the list of box children. The list is the both widgets packed <gtk-pack-start> as well as widgets packed <gtk-pack-end>, in the order that these widgets were added to box.

A widget’s position in the box children list determines where the widget is packed into box. A child widget at some position in the list will be packed just after all other widgets of the same packing type that appear earlier in the list.

box a <gtk-box>.

child the <gtk-widget> to move.

position the new position for child in the <gtk-box>, starting from 0. If negative, indicates the end of the list.

gtk-box-set-child-packing (self <gtk-box>) (child <gtk-widget>) (expand bool) (fill bool) (padding unsigned-int) (pack-type <gtk-pack-type>)

set-child-packing

Sets the way child is packed into box.

box a <gtk-box>.

child the <gtk-widget> of the child to set.

expand the new value of the

fill the new value of the

padding the new value of the

pack-type the new value of the
128 GtkButtonBox

Base class for and

128.1 Overview

The primary purpose of this class is to keep track of the various properties of <gtk-hbutton-box> and <gtk-vbutton-box> widgets.

`gtk-button-box-get-child-size` retrieves the minimum width and height for widgets in a given button box. `gtk-button-box-set-child-size` allows those properties to be changed.

The internal padding of buttons can be retrieved and changed per button box using `gtk-button-box-get-child-ipadding` and `gtk-button-box-set-child-ipadding` respectively.

`gtk-button-box-get-spacing` and `gtk-button-box-set-spacing` retrieve and change the default number of pixels between buttons, respectively.

`gtk-button-box-get-layout` and `gtk-button-box-set-layout` retrieve and alter the method used to spread the buttons in a button box across the container, respectively.

The main purpose of GtkButtonBox is to make sure the children have all the same size. Therefore it ignores the homogeneous property which it inherited from GtkBox, and always behaves as if homogeneous was ‘#t’.

128.2 Usage

```plaintext
<gtk-button-box>
   Derives from <gtk-box>.
   This class defines the following slots:
   layout-style
      How to layout the buttons in the box. Possible values are default, spread, edge, start and end

   `gtk-button-box-get-layout (self <gtk-button-box>)` [Function]
   ⇒ (ret <gtk-button-box-style>)
   get-layout
      Retrieves the method being used to arrange the buttons in a button box.

      widget  a <gtk-button-box>.
      ret    the method used to layout buttons in widget.

   `gtk-button-box-get-child-secondary (self <gtk-button-box>)` [Function]
   (child <gtk-widget>) ⇒ (ret bool)
   get-child-secondary
      Returns whether child should appear in a secondary group of children.

      widget  a <gtk-button-box>
      child   a child of widget
```
whether child should appear in a secondary group of children.

Since 2.4

```c
gtk-button-box-set-layout (self <gtk-button-box>)
(layout_style <gtk-button-box-style>)
```

Changes the way buttons are arranged in their container.

- `widget` a `<gtk-button-box>`.
- `layout-style` the new layout style.

```c
gtk-button-box-set-child-secondary (self <gtk-button-box>)
(child <gtk-widget>) (is_secondary bool)
```

Sets whether child should appear in a secondary group of children. A typical use of a secondary child is the help button in a dialog.

This group appears after the other children if the style is ‘GTK_BUTTONBOX_START’, ‘GTK_BUTTONBOX_SPREAD’ or ‘GTK_BUTTONBOX_EDGE’, and before the other children if the style is ‘GTK_BUTTONBOX_END’. For horizontal button boxes, the definition of before/after depends on direction of the widget (see `gtk-widget-set-direction`). If the style is ‘GTK_BUTTONBOX_START’ or ‘GTK_BUTTONBOX_END’, then the secondary children are aligned at the other end of the button box from the main children. For the other styles, they appear immediately next to the main children.

- `widget` a `<gtk-button-box>`
- `child` a child of `widget`
- `is-secondary` if ‘#t’, the child appears in a secondary group of the button box.
129 GtkContainer

Base class for widgets which contain other widgets

129.1 Overview

A GTK+ user interface is constructed by nesting widgets inside widgets. Container widgets are the inner nodes in the resulting tree of widgets: they contain other widgets. So, for example, you might have a <gtk-window> containing a <gtk-frame> containing a GtkLabel. If you wanted an image instead of a textual label inside the frame, you might replace the <gtk-label> widget with a <gtk-image> widget.

There are two major kinds of container widgets in GTK+. Both are subclasses of the abstract <gtk-container> base class.

The first type of container widget has a single child widget and derives from <gtk-bin>. These containers are decorators, which add some kind of functionality to the child. For example, a <gtk-button> makes its child into a clickable button; a <gtk-frame> draws a frame around its child and a <gtk-window> places its child widget inside a top-level window.

The second type of container can have more than one child; its purpose is to manage layout. This means that these containers assign sizes and positions to their children. For example, a <gtk-hbox> arranges its children in a horizontal row, and a <gtk-table> arranges the widgets it contains in a two-dimensional grid.

To fulfill its task, a layout container must negotiate the size requirements with its parent and its children. This negotiation is carried out in two phases, size requisition and size allocation.

129.2 Size Requisition

The size requisition of a widget is it’s desired width and height. This is represented by a <gtk-requisition>.

How a widget determines its desired size depends on the widget. A <gtk-label>, for example, requests enough space to display all its text. Container widgets generally base their size request on the requisitions of their children.

The size requisition phase of the widget layout process operates top-down. It starts at a top-level widget, typically a <gtk-window>. The top-level widget asks its child for its size requisition by calling gtk-widget-size-request. To determine its requisition, the child asks its own children for their requisitions and so on. Finally, the top-level widget will get a requisition back from its child.

129.3 Size Allocation

When the top-level widget has determined how much space its child would like to have, the second phase of the size negotiation, size allocation, begins. Depending on its configuration (see gtk-window-set-resizable), the top-level widget may be able to expand in order to satisfy the size request or it may have to ignore the size request and keep its fixed size. It then tells its child widget how much space it gets by calling gtk-widget-size-allocate. The child widget divides the space among its children and tells each child how much space
it got, and so on. Under normal circumstances, a `<gtk-window>` will always give its child the amount of space the child requested.

A child’s size allocation is represented by a `<gtk-allocation>`. This struct contains not only a width and height, but also a position (i.e. X and Y coordinates), so that containers can tell their children not only how much space they have gotten, but also where they are positioned inside the space available to the container.

Widgets are required to honor the size allocation they receive; a size request is only a request, and widgets must be able to cope with any size.

### 129.4 Child properties

introduces child properties - these are object properties that are not specific to either the container or the contained widget, but rather to their relation. Typical examples of child properties are the position or pack-type of a widget which is contained in a `<gtk-box>`.

Use `gtk-container-class-install-child-property` to install child properties for a container class and `gtk-container-class-find-child-property` or `gtk-container-class-list-child-properties` to get information about existing child properties.

### 129.5 Usage

`<gtk-container>`

Derives from `<gtk-widget>`.

This class defines the following slots:

- `border-width`
  The width of the empty border outside the container’s children

- `resize-mode`
  Specify how resize events are handled

- `child`
  Can be used to add a new child to the container

**Function**

`gtk-container-add (self <gtk-container>) (widget <gtk-widget>)`

Add `widget` to `container`. Typically used for simple containers such as `<gtk-window>`, `<gtk-frame>`, or `<gtk-button>`; for more complicated layout containers such as `<gtk-box>` or `<gtk-table>`, this function will pick default packing parameters that may
not be correct. So consider functions such as `gtk-box-pack-start` and `gtk-table-attach` as an alternative to `gtk-container-add` in those cases. A widget may be added to only one container at a time; you can’t place the same widget inside two different containers.

```plaintext
container a <gtk-container>
widget a widget to be placed inside container
```

```c
gtk-container-remove (self <gtk-container>) (widget <gtk-widget>)
```

**remove**

Removes `widget` from `container`. `widget` must be inside `container`. Note that `container` will own a reference to `widget`, and that this may be the last reference held; so removing a widget from its container can destroy that widget. If you want to use `widget` again, you need to add a reference to it while it's not inside a container, using `g-object-ref`. If you don’t want to use `widget` again it’s usually more efficient to simply destroy it directly using `gtk-widget-destroy` since this will remove it from the container and help break any circular reference count cycles.

```plaintext
container a <gtk-container>
widget a current child of container
```

```c
gtk-container-get-resize-mode (self <gtk-container>) ⇒ (ret <gtk-resize-mode>)
```

**get-resize-mode**

Returns the resize mode for the container. See `gtk-container-set-resize-mode`.

```plaintext
container a <gtk-container>
ret the current resize mode
```

```c
gtk-container-set-resize-mode (self <gtk-container>) (resize_mode <gtk-resize-mode>)
```

**set-resize-mode**

Sets the resize mode for the container.

The resize mode of a container determines whether a resize request will be passed to the container’s parent, queued for later execution or executed immediately.

```plaintext
container a <gtk-container>.
resize-mode the new resize mode.
```

```c
gtk-container-check-resize (self <gtk-container>)
```

**check-resize**

```c
gtk-container-get-children (self <gtk-container>) ⇒ (ret glist-of)
```

**get-children**

Returns the container’s non-internal children. See `gtk-container-forall` for details on what constitutes an "internal" child.
container  a <gtk-container>.
ret  a newly-allocated list of the container’s non-internal children.

```python
gtk-container-set-focus-child (self <gtk-container>)
    (child <gtk-widget>)
set-focus-child
    container
    child
```

```python
gtk-container-get-focus-vadjustment (self <gtk-container>)
⇒ (ret <gtk-adjustment>)
get-focus-vadjustment
    container  a <gtk-container>
    ret  the vertical focus adjustment, or ‘#f’ if none has been set.
```

```python
gtk-container-set-focus-vadjustment (self <gtk-container>)
    (adjustment <gtk-adjustment>)
set-focus-vadjustment
    container  a <gtk-container>
    adjustment  an adjustment which should be adjusted when the focus is moved among the descendents of container
```

```python
gtk-container-get-focus-hadjustment (self <gtk-container>)
⇒ (ret <gtk-adjustment>)
get-focus-hadjustment
    container  a <gtk-container>
    ret  the horizontal focus adjustment, or ‘#f’ if none has been set.
```

```python
gtk-container-set-focus-hadjustment (self <gtk-container>)
    (adjustment <gtk-adjustment>)
set-focus-hadjustment
    container  a <gtk-container>
    adjustment  an adjustment which should be adjusted when the focus is moved among the descendents of container
```

Hooks up an adjustment to focus handling in a container, so when a child of the container is focused, the adjustment is scrolled to show that widget. This function sets the vertical alignment. See `gtk-scrolled-window-get-vadjustment` for a typical way of obtaining the adjustment and `gtk-container-set-focus-hadjustment` for setting the horizontal adjustment.

The adjustments have to be in pixel units and in the same coordinate system as the allocation for immediate children of the container.

the horizontal alignment. See `gtk-scrolled-window-get-hadjustment` for a typical way of obtaining the adjustment and `gtk-container-set-focus-vadjustment` for setting the vertical adjustment.

The adjustments have to be in pixel units and in the same coordinate system as the allocation for immediate children of the container.

```c
container a <gtk-container>
adjustment an adjustment which should be adjusted when the focus is moved among the descendents of `container`
```

```c
gtk-container-child-type (self <gtk-container>)
⇒ (ret <gtype>)
child-type
Returns the type of the children supported by the container.
Note that this may return ‘G_TYPE_NONE’ to indicate that no more children can be added, e.g. for a `<gtk-paned>` which already has two children.
```

```c
gtk-container-child-get-property (self <gtk-container>)
(child <gtk-widget>) (property-name mchars) (value <gvalue>)
child-get-property
Gets the value of a child property for `child` and `container`.
```

```c
gtk-container-child-set-property (self <gtk-container>)
(child <gtk-widget>) (property-name mchars) (value <gvalue>)
child-set-property
Sets a child property for `child` and `container`.
```
gtk-container-get-border-width (self <gtk-container>) [Function]  
⇒ (ret unsigned-int)  
get-border-width [Method]  
Retrieves the border width of the container. See gtk-container-set-border-width.

container  a <gtk-container>  
ret  the current border width  

gtk-container-set-border-width (self <gtk-container>) [Function]  
(border_width unsigned-int)  
set-border-width [Method]  
Sets the border width of the container.

The border width of a container is the amount of space to leave around the outside of the container. The only exception to this is <gtk-window>; because toplevel windows can’t leave space outside, they leave the space inside. The border is added on all sides of the container. To add space to only one side, one approach is to create a <gtk-alignment> widget, call gtk-widget-set-usize to give it a size, and place it on the side of the container as a spacer.

container  a <gtk-container>  
border-width  amount of blank space to leave outside the container. Valid values are in the range 0-65535 pixels.  

gtk-container-propagate-expose (self <gtk-container>) [Function]  
(propagate-expose (child <gtk-widget>) (event <gdk-event-expose>)) [Method]  
When a container receives an expose event, it must send synthetic expose events to all children that don’t have their own <gdk-windows>. This function provides a convenient way of doing this. A container, when it receives an expose event, calls gtk-container-propagate-expose once for each child, passing in the event the container received.

gtk-container-propagate-expose takes care of deciding whether an expose event needs to be sent to the child, intersecting the event’s area with the child area, and sending the event.

In most cases, a container can simply either simply inherit the ::expose implementation from <gtk-container>, or, do some drawing and then chain to the ::expose implementation from <gtk-container>.

container  a <gtk-container>  
child  a child of container  
event  a expose event sent to container  

gtk-container-set-focus-chain (self <gtk-container>) [Function]  
(set-focus-chain (focusable_widgets glist-of) [Method]  
Sets a focus chain, overriding the one computed automatically by GTK+.  

In principle each widget in the chain should be a descendant of the container, but
this is not enforced by this method, since it’s allowed to set the focus chain before
you pack the widgets, or have a widget in the chain that isn’t always packed. The
necessary checks are done when the focus chain is actually traversed.

container  a <gtk-container>.

focusable-widgets  the new focus chain.

gtk-container-unset-focus-chain (self <gtk-container>)  [Function]
unset-focus-chain  [Method]
Removes a focus chain explicitly set with gtk-container-set-focus-chain.

container  a <gtk-container>.
130 GtkItem

Abstract base class for GtkMenuItem, GtkListItem and GtkTreeItem

130.1 Overview

The <gtk-item> widget is an abstract base class for <gtk-menu-item>, <gtk-list-item> and <gtk-tree-item>.

130.2 Usage

<gtk-item> [Class]

Derives from <gtk-bin>.

This class defines no direct slots.

select [Signal on <gtk-item>]

Emitted when the item is selected.

deselect [Signal on <gtk-item>]

Emitted when the item is deselected.

toggle [Signal on <gtk-item>]

Emitted when the item is toggled.

gtk-item-select (self <gtk-item>) [Function]

select [Method]

Emits the "select" signal on the given item.

item a <gtk-item>.

gtk-item-deselect (self <gtk-item>) [Function]

deselect [Method]

Emits the "deselect" signal on the given item.

item a <gtk-item>.

gtk-item-toggle (self <gtk-item>) [Function]

toggle [Method]

Emits the "toggle" signal on the given item.

item a <gtk-item>.
131 GtkMisc

Base class for widgets with alignments and padding

131.1 Overview

The `<gtk-misc>` widget is an abstract widget which is not useful itself, but is used to derive subclasses which have alignment and padding attributes.

The horizontal and vertical padding attributes allows extra space to be added around the widget.

The horizontal and vertical alignment attributes enable the widget to be positioned within its allocated area. Note that if the widget is added to a container in such a way that it expands automatically to fill its allocated area, the alignment settings will not alter the widgets position.

131.2 Usage

`<gtk-misc>`

[Class]

Derives from `<gtk-widget>`.

This class defines the following slots:

- `xalign` The horizontal alignment, from 0 (left) to 1 (right). Reversed for RTL layouts.
- `yalign` The vertical alignment, from 0 (top) to 1 (bottom)
- `xpad` The amount of space to add on the left and right of the widget, in pixels
- `ypad` The amount of space to add on the top and bottom of the widget, in pixels

`gtk-misc-set-alignment (self <gtk-misc>) (xalign float) (yalign float)` [Function]

`set-alignment` [Method]

Sets the alignment of the widget.

- `misc` a `<gtk-misc>`.
- `xalign` the horizontal alignment, from 0 (left) to 1 (right).
- `yalign` the vertical alignment, from 0 (top) to 1 (bottom).

`gtk-misc-set-padding (self <gtk-misc>) (xpad int) (ypad int)` [Function]

`set-padding` [Method]

Sets the amount of space to add around the widget.

- `misc` a `<gtk-misc>`.
- `xpad` the amount of space to add on the left and right of the widget, in pixels.
- `ypad` the amount of space to add on the top and bottom of the widget, in pixels.
gtk-misc-get-alignment (self <gtk-misc>) ⇒ (xalign float)  [Function]
    (yalign float)
get-alignment  [Method]
    Gets the X and Y alignment of the widget within its allocation. See gtk-misc-set-alignment.
    
misc         a <gtk-misc>
xalign       location to store X alignment of misc, or ‘#f’
yalign       location to store Y alignment of misc, or ‘#f’

gtk-misc-get-padding (self <gtk-misc>) ⇒ (xpad int) (ypad int)  [Function]
get-padding  [Method]
    Gets the padding in the X and Y directions of the widget. See gtk-misc-set-padding.
    
misc         a <gtk-misc>
xpad         location to store padding in the X direction, or ‘#f’
ypad         location to store padding in the Y direction, or ‘#f’
Chapter 132: GtkObject

The base class of the GTK+ type hierarchy

132.1 Overview

132.2 Description

<gtk-object> is the base class for all widgets, and for a few non-widget objects such as <gtk-adjustment>. <gtk-object> predates <gobject>; non-widgets that derive from <gtk-object> rather than <gobject> do so for backward compatibility reasons.

<gtk-object>s are created with a "floating" reference count. This means that the initial reference is not owned by anyone. Calling g-object-unref on a newly-created <gtk-object> is incorrect, the floating reference has to be removed first. This can be done by anyone at any time, by calling g-object-ref-sink to convert the floating reference into a regular reference. g-object-ref-sink returns a new reference if an object is already sunk (has no floating reference).

When you add a widget to its parent container, the parent container will do this: This means that the container now owns a reference to the child widget and the child widget has no floating reference.

        g_object_ref_sink (G_OBJECT (child_widget));

The purpose of the floating reference is to keep the child widget alive until you add it to a parent container:

        button = gtk_button_new ();
        /* button has one floating reference to keep it alive */
        gtk_container_add (GTK_CONTAINER (container), button);
        /* button has one non-floating reference owned by the container */

<gtk-window> is a special case, because GTK+ itself will ref/sink it on creation. That is, after calling gtk-window-new, the <gtk-window> will have one reference which is owned by GTK+, and no floating references.

One more factor comes into play: the "destroy" signal, emitted by the gtk-object-destroy method. The "destroy" signal asks all code owning a reference to an object to release said reference. So, for example, if you call gtk-object-destroy on a <gtk-window>, GTK+ will release the reference count that it owns; if you call gtk-object-destroy on a <gtk-button>, then the button will be removed from its parent container and the parent container will release its reference to the button. Because these references are released, calling gtk-object-destroy should result in freeing all memory associated with an object, unless some buggy code fails to release its references in response to the "destroy" signal. Freeing memory (referred to as finalization only happens if the reference count reaches zero.

Some simple rules for handling <gtk-object>:

Never call g-object-unref unless you have previously called g-object-ref, even if you created the <gtk-object>. (Note: this is not true for <gobject>; for <gobject>, the creator of the object owns a reference.)
Call `gtk-object-destroy` to get rid of most objects in most cases. In particular, widgets are almost always destroyed in this way.

Because of the floating reference count, you don’t need to worry about reference counting for widgets and toplevel windows, unless you explicitly call `g-object-ref` yourself.

### 132.3 Usage

```
<gtk-object>
[Class]

Derives from `<g-initially-unowned>`.

This class defines the following slots:

user-data
  Anonymous User Data Pointer

destroy
[Signal on `<gtk-object>`]

Signals that all holders of a reference to the `<gtk-object>` should release the reference that they hold. May result in finalization of the object if all references are released.
```
133 GtkPaned

Base class for widgets with two adjustable panes

133.1 Overview

<gtk-paned> is the base class for widgets with two panes, arranged either horizontally (<gtk-hpaned>) or vertically (<gtk-vpaned>). Child widgets are added to the panes of the widget with gtk-paned-pack1 and gtk-paned-pack2. The division between the two children is set by default from the size requests of the children, but it can be adjusted by the user.

A paned widget draws a separator between the two child widgets and a small handle that the user can drag to adjust the division. It does not draw any relief around the children or around the separator. (The space in which the separator is called the gutter.) Often, it is useful to put each child inside a <gtk-frame> with the shadow type set to ‘GTK_SHADOW_IN’ so that the gutter appears as a ridge.

Each child has two options that can be set, resize and shrink. If resize is true, then when the <gtk-paned> is resized, that child will expand or shrink along with the paned widget. If shrink is true, then when that child can be made smaller than its requisition by the user. Setting shrink to ‘#f’ allows the application to set a minimum size. If resize is false for both children, then this is treated as if resize is true for both children.

The application can set the position of the slider as if it were set by the user, by calling gtk-paned-set-position.

```c
GtkWidget *hpaned = gtk_hpaned_new();
GtkWidget *frame1 = gtk_frame_new(NULL);
GtkWidget *frame2 = gtk_frame_new(NULL);
gtk_frame_set_shadow_type(GTK_FRAME(frame1), GTK_SHADOW_IN);
gtk_frame_set_shadow_type(GTK_FRAME(frame2), GTK_SHADOW_IN);

GtkWidget *hpaned = gtk_hpaned_new();
GtkWidget *frame1 = gtk_frame_new(NULL);
GtkWidget *frame2 = gtk_frame_new(NULL);
gtk_frame_set_shadow_type(GTK_FRAME(frame1), GTK_SHADOW_IN);
gtk_frame_set_shadow_type(GTK_FRAME(frame2), GTK_SHADOW_IN);

gtk_widget_set_size_request (hpaned, 200 + GTK_PANED (hpaned)->gutter_size, -1);
gtk_paned_pack1 (GTK_PANED (hpaned), frame1, TRUE, FALSE);
gtk_widget_set_size_request (frame1, 50, -1);
gtk_paned_pack2 (GTK_PANED (hpaned), frame2, FALSE, FALSE);
gtk_widget_set_size_request (frame2, 50, -1);
```

133.2 Usage

<gtk-paned>  
Derives from <gtk-container>.
This class defines the following slots:

- position  Position of paned separator in pixels (0 means all the way to the left/top)
- position-set  TRUE if the Position property should be used
min-position
Smallest possible value for the "position" property

max-position
Largest possible value for the "position" property

cycle-child-focus (arg0 <gboolean>) ⇒ <gboolean>  [Signal on <gtk-paned>]
toggle-handle-focus ⇒ <gboolean>  [Signal on <gtk-paned>]
move-handle (arg0 <gtk-scroll-type>) ⇒ <gboolean>  [Signal on <gtk-paned>]
cycle-handle-focus (arg0 <gboolean>) ⇒ <gboolean>  [Signal on <gtk-paned>]
accept-position ⇒ <gboolean>  [Signal on <gtk-paned>]
cancel-position ⇒ <gboolean>  [Signal on <gtk-paned>]

gtk-paned-add1 (self <gtk-paned>) (child <gtk-widget>)  [Function]
add1  [Method]
    Adds a child to the top or left pane with default parameters. This is equivalent to
    ‘gtk_paned_pack1 (paned, child, FALSE, TRUE)’.
    paned  a paned widget
    child  the child to add

gtk-paned-add2 (self <gtk-paned>) (child <gtk-widget>)  [Function]
add2  [Method]
    Adds a child to the bottom or right pane with default parameters. This is equivalent to
    ‘gtk_paned_pack2 (paned, child, TRUE, TRUE)’.
    paned  a paned widget
    child  the child to add

gtk-paned-pack1 (self <gtk-paned>) (child <gtk-widget>)
    (resize bool) (shrink bool)  [Function]
pack1  [Method]
    Adds a child to the top or left pane.
    paned  a paned widget
    child  the child to add
    resize  should this child expand when the paned widget is resized.
    shrink  can this child be made smaller than its requisition.

gtk-paned-pack2 (self <gtk-paned>) (child <gtk-widget>)
    (resize bool) (shrink bool)  [Function]
pack2  [Method]
    Adds a child to the bottom or right pane.
    paned  a paned widget
    child  the child to add
    resize  should this child expand when the paned widget is resized.
    shrink  can this child be made smaller than its requisition.
**gtk-paned-get-child1** (*self <gtk-paned>* ⇒ (*ret <gtk-widget>*))

*Method*

Obtains the first child of the paned widget.

`paned` a `<gtk-paned>` widget

`ret` first child, or `'#f'` if it is not set.

Since 2.4

**gtk-paned-get-child2** (*self <gtk-paned>* ⇒ (*ret <gtk-widget>*))

*Method*

Obtains the second child of the paned widget.

`paned` a `<gtk-paned>` widget

`ret` second child, or `'#f'` if it is not set.

Since 2.4

**gtk-paned-set-position** (*self <gtk-paned>* (*position int*))

*Method*

Sets the position of the divider between the two panes.

`paned` a `<gtk-paned>` widget

`position` pixel position of divider, a negative value means that the position is unset.

**gtk-paned-get-position** (*self <gtk-paned>* ⇒ (*ret int*))

*Method*

Obtains the position of the divider between the two panes.

`paned` a `<gtk-paned>` widget

`ret` position of the divider
134 GtkRange

Base class for widgets which visualize an adjustment

134.1 Overview

134.2 Usage

<gtk-range>  
Derives from <gtk-widget>.  
This class defines the following slots:

update-policy  
How the range should be updated on the screen

adjustment  
The GtkAdjustment that contains the current value of this range object

inverted  
Invert direction slider moves to increase range value

lower-stepper-sensitivity  
The sensitivity policy for the stepper that points to the adjustment’s lower side

upper-stepper-sensitivity  
The sensitivity policy for the stepper that points to the adjustment’s upper side

show-fill-level  
Whether to display a fill level indicator graphics on trough.

restrict-to-fill-level  
Whether to restrict the upper boundary to the fill level.

fill-level  
The fill level.

value-changed  
Emitted when the range value changes.

adjust-bounds (arg0 <gdouble>)  
[Signal on <gtk-range>]

move-slider (arg0 <gtk-scroll-type>)  
Virtual function that moves the slider. Used for keybindings.

change-value (arg0 <gtk-scroll-type>)  
(arg1 <gdouble>) ⇒ <gboolean>  
The ::change-value signal is emitted when a scroll action is performed on a range. It allows an application to determine the type of scroll event that occurred and the resultant new value. The application can handle the event itself and return ‘#t’ to prevent further processing. Or, by returning ‘#f’, it can pass the event to other handlers until the default GTK+ handler is reached.
The value parameter is unrounded. An application that overrides the ::change-value
signal is responsible for clamping the value to the desired number of decimal digits;
the default GTK+ handler clamps the value based on range->round-digits.
It is not possible to use delayed update policies in an overridden ::change-value han-
dler.

Since 2.6

```
gtk-range-get-adjustment (self <gtk-range>) ⇒ (ret <gtk-adjustment>)
```

**get-adjustment**

Get the <gtk-adjustment> which is the "model" object for <gtk-range>. See gtk-
range-set-adjustment for details. The return value does not have a reference added,
so should not be unreferenced.

range  a <gtk-range>
ret     a <gtk-adjustment>

```
gtk-range-set-update-policy (self <gtk-range>) (policy <gtk-update-type>)
```

**set-update-policy**

Sets the update policy for the range. <gtk-update-continuous> means that anytime
the range slider is moved, the range value will change and the value_changed signal
will be emitted. <gtk-update-delayed> means that the value will be updated after
a brief timeout where no slider motion occurs, so updates are spaced by a short
time rather than continuous. <gtk-update-discontinuous> means that the value
will only be updated when the user releases the button and ends the slider drag
operation.

range  a <gtk-range>
policy update policy

```
gtk-range-set-adjustment (self <gtk-range>) (adjustment <gtk-adjustment>)
```

**set-adjustment**

Sets the adjustment to be used as the "model" object for this range widget. The
adjustment indicates the current range value, the minimum and maximum range
values, the step/page increments used for keybindings and scrolling, and the page
size. The page size is normally 0 for <gtk-scale> and nonzero for <gtk-scrollbar>,
and indicates the size of the visible area of the widget being scrolled. The page size
affects the size of the scrollbar slider.

range  a <gtk-range>
adjustment  a <gtk-adjustment>

```
gtk-range-get-inverted (self <gtk-range>) ⇒ (ret bool)
```

**get-inverted**

Gets the value set by gtk-range-set-inverted.
Ranges normally move from lower to higher values as the slider moves from top to bottom or left to right. Inverted ranges have higher values at the top or on the right rather than on the bottom or left.

```
gtk-range-set-inverted (self <gtk-range>) (setting bool) ⇒ (ret #t)  [Function]
set-inverted

Renames a range so that the intermediate values are displayed in reverse order.

range a <gtk-range>
setting 't to invert the range
```

```
gtk-range-get-update-policy (self <gtk-range>) ⇒ (ret <gtk-update-type>)  [Function]
get-update-policy

Gets the update policy of range. See gtk-range-set-update-policy.

range a <gtk-range>
ret the current update policy
```

```
gtk-range-get-value (self <gtk-range>) ⇒ (ret double)  [Function]
get-value

Gets the current value of the range.

range a <gtk-range>
ret current value of the range.
```

```
gtk-range-set-increments (self <gtk-range>) (step double) (page double)  [Function]
set-increments

Sets the step and page sizes for the range. The step size is used when the user clicks the <gtk-scrollbar> arrows or moves <gtk-scale> via arrow keys. The page size is used for example when moving via Page Up or Page Down keys.

range a <gtk-range>
step step size
page page size
```

```
gtk-range-set-range (self <gtk-range>) (min double) (max double)  [Function]
set-range

Sets the allowable values in the <gtk-range>, and clamps the range value to be between min and max. (If the range has a non-zero page size, it is clamped between min and max - page-size.)

range a <gtk-range>
min minimum range value
max maximum range value
```
gtk-range-set-value (self <gtk-range>) (value double)  [Function]
set-value  [Method]

Sets the current value of the range; if the value is outside the minimum or maximum range values, it will be clamped to fit inside them. The range emits the "value_changed" signal if the value changes.

range a <gtk-range>
value new value of the range
Chapter 135: GtkScale

135  GtkScale

Base class for GtkHScale and GtkVScale

135.1  Overview

A <gtk-scale> is a slider control used to select a numeric value. To use it, you’ll probably want to investigate the methods on its base class, <gtk-range>, in addition to the methods for <gtk-scale> itself. To set the value of a scale, you would normally use gtk-range-set-value. To detect changes to the value, you would normally use the "value_changed" signal.

The <gtk-scale> widget is an abstract class, used only for deriving the subclasses <gtk-hscale> and <gtk-vscale>. To create a scale widget, call gtk-hscale-new-with-range or gtk-vscale-new-with-range.

135.2  Usage

<gtk-scale>  [Class]
Derives from <gtk-range>.
This class defines the following slots:
digits       The number of decimal places that are displayed in the value
draw-value   Whether the current value is displayed as a string next to the slider
value-pos    The position in which the current value is displayed

format-value (arg0 <gdouble>) ⇒ <gchararray>  [Signal on <gtk-scale>]
Signal which allows you to change how the scale value is displayed. Connect a signal handler which returns an allocated string representing value. That string will then be used to display the scale’s value. Here’s an example signal handler which displays a value 1.0 as with "--1.0<--".

    static gchar*
    format_value_callback (GtkScale *scale,
                            gdouble    value)
    {
        return g_strdup_printf ("--%0.*g<--",
                                gtk_scale_get_digits (scale),
                                value);
    }

gtk-scale-set-digits (self <gtk-scale>) (digits int)  [Function]
set-digits
Sets the number of decimal places that are displayed in the value. Also causes the value of the adjustment to be rounded off to this number of digits, so the retrieved value matches the value the user saw.

    scale           a <gtk-scale>.
The number of decimal places to display, e.g., use 1 to display 1.0, 2 to display 1.00 etc.

gtk-scale-set-draw-value (self <gtk-scale>) (draw_value bool)

Specifies whether the current value is displayed as a string next to the slider.

scale a <gtk-scale>.
draw_value a boolean.

gtk-scale-set-value-pos (self <gtk-scale>)

Sets the position in which the current value is displayed.

scale a <gtk-scale>.
pos the position in which the current value is displayed.

gtk-scale-get-digits (self <gtk-scale>) ⇒ (ret int)

Gets the number of decimal places that are displayed in the value.

scale a <gtk-scale>.
ret the number of decimal places that are displayed.

gtk-scale-get-draw-value (self <gtk-scale>) ⇒ (ret bool)

Returns whether the current value is displayed as a string next to the slider.

scale a <gtk-scale>.
ret whether the current value is displayed as a string.

gtk-scale-get-value-pos (self <gtk-scale>) ⇒ (ret <gtk-position-type>)

Gets the position in which the current value is displayed.

scale a <gtk-scale>.
ret the position in which the current value is displayed.

gtk-scale-get-layout (self <gtk-scale>) ⇒ (ret <pango-layout>)

Gets the <pango-layout> used to display the scale. The returned object is owned by
the scale so does not need to be freed by the caller.

scale A <gtk-scale>
ret the <pango-layout> for this scale, or ‘#f’ if the draw_value property is ‘#f’.

Since 2.4
gtk-scale-get-layout-offsets (self <gtk-scale>) ⇒ (x int)  
(y int)  

get-layout-offsets  
Obtains the coordinates where the scale will draw the <pango-layout> representing the text in the scale. Remember when using the <pango-layout> function you need to convert to and from pixels using pango-pixels or <pango-scale>. If the draw_value property is ‘#f’, the return values are undefined.

scale  a <gtk-scale>  
x  location to store X offset of layout, or ‘#f’  
y  location to store Y offset of layout, or ‘#f’  

Since 2.4
136 GtkScrollbar

Base class for GtkHScrollbar and GtkVScrollbar

136.1 Overview

The <gtk-scrollbar> widget is an abstract base class for <gtk-hscrollbar> and <gtk-vscrollbar>. It is not very useful in itself.

The position of the thumb in a scrollbar is controlled by the scroll adjustments. See <gtk-adjustment> for the fields in an adjustment - for <gtk-scrollbar>, the "value" field represents the position of the scrollbar, which must be between the "lower" field and "upper - page_size." The "page_size" field represents the size of the visible scrollable area. The "step_increment" and "page_increment" fields are used when the user asks to step down (using the small stepper arrows) or page down (using for example the PageDown key).

136.2 Usage

<gtk-scrollbar> [Class]

Derives from <gtk-range>.

This class defines no direct slots.
137 GtkSeparator

Base class for and

137.1 Overview
The `<gtk-separator>` widget is an abstract class, used only for deriving the subclasses `<gtk-hseparator>` and `<gtk-vseparator>`.

137.2 Usage

 `<gtk-separator>` [Class]
  Derives from `<gtk-widget>`.
  This class defines no direct slots.
138 GtkWidget

Base class for all widgets

138.1 Overview

Introduces style properties - these are basically object properties that are stored not on the object, but in the style object associated to the widget. Style properties are set in resource files. This mechanism is used for configuring such things as the location of the scrollbar arrows through the theme, giving theme authors more control over the look of applications without the need to write a theme engine in C.

Use `gtk-widget-class-install-style-property` to install style properties for a widget class, `gtk-widget-class-find-style-property` or `gtk-widget-class-list-style-properties` to get information about existing style properties and `gtk-widget-style-get-property`, `gtk-widget-style-get` or `gtk-widget-style-get-valist` to obtain the value of a style property.

138.2 Usage

```
<gtk-widget>
   [Class]
   Derives from `<atk-implementor-iface>, <gtk-buildable>, <gtk-object>.
   This class defines the following slots:
   name       The name of the widget
   parent     The parent widget of this widget. Must be a Container widget
   width-request
               Override for width request of the widget, or -1 if natural request should be used
   height-request
               Override for height request of the widget, or -1 if natural request should be used
   visible    Whether the widget is visible
   sensitive  Whether the widget responds to input
   app-paintable
               Whether the application will paint directly on the widget
   can-focus  Whether the widget can accept the input focus
   has-focus  Whether the widget has the input focus
   is-focus   Whether the widget is the focus widget within the toplevel
   can-default
               Whether the widget can be the default widget
```
has-default
  Whether the widget is the default widget

receives-default
  If TRUE, the widget will receive the default action when it is focused

composite-child
  Whether the widget is part of a composite widget

style
  The style of the widget, which contains information about how it will look (colors etc)

events
  The event mask that decides what kind of GdkEvents this widget gets

extension-events
  The mask that decides what kind of extension events this widget gets

no-show-all
  Whether gtk_widget_show_all() should not affect this widget

has-tooltip
  Whether this widget has a tooltip

tooltip-markup
  The contents of the tooltip for this widget

tooltip-text
  The contents of the tooltip for this widget

composited-changed [Signal on <gtk-widget>]

show [Signal on <gtk-widget>]

hide [Signal on <gtk-widget>]

map [Signal on <gtk-widget>]

unmap [Signal on <gtk-widget>]

realize [Signal on <gtk-widget>]

unrealize [Signal on <gtk-widget>]

size-request (arg0 <gtk-requisition>) [Signal on <gtk-widget>]

size-allocate (arg0 <gdk-rectangle>) [Signal on <gtk-widget>]

state-changed (arg0 <gtk-state-type>) [Signal on <gtk-widget>]

parent-set (arg0 <gtk-widget>) [Signal on <gtk-widget>]
  The parent-set signal is emitted when a new parent has been set on a widget.

hierarchy-changed (arg0 <gtk-widget>) [Signal on <gtk-widget>]
  Emitted when there is a chance in the hierarchy to which a widget belong. More precisely, a widget is anchored when its toplevel ancestor is a <gtk-window>. This signal is emitted when a widget changes from un-anchored to anchored or vice-versa.
style-set (arg0 <gtk-style>) [Signal on <gtk-widget>]
The style-set signal is emitted when a new style has been set on a widget. Note that style-modifying functions like gtk-widget-modify-base also cause this signal to be emitted.

direction-changed (arg0 <gtk-text-direction>) [Signal on <gtk-widget>]

grab-notify (arg0 <gboolean>) [Signal on <gtk-widget>]
The ::grab-notify signal is emitted when a widget becomes shadowed by a GTK+ grab (not a pointer or keyboard grab) on another widget, or when it becomes unshadowed due to a grab being removed.

A widget is shadowed by a gtk-grab-add when the topmost grab widget in the grab stack of its window group is not its ancestor.

child-notify (arg0 <gparam>) [Signal on <gtk-widget>]
The ::child-notify signal is emitted for each child property that has changed on an object. The signal’s detail holds the property name.

mnemonic-activate (arg0 <gboolean>) ⇒ <gboolean> [Signal on <gtk-widget>]
grab-focus [Signal on <gtk-widget>]
focus (arg0 <gtk-direction-type>) ⇒ <gboolean> [Signal on <gtk-widget>]
move-focus (arg0 <gtk-direction-type>) undocumented

event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
event-after (arg0 <gdk-event>) [Signal on <gtk-widget>]
button-press-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
button-release-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
scroll-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
motion-notify-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
keynav-failed (arg0 <gtk-direction-type>) ⇒ <gboolean> undocumented

delete-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
The ::delete-event signal is emitted if a user requests that a toplevel window is closed. The default handler for this signal destroys the window. Connecting gtk-widget-hide-on-delete to this signal will cause the window to be hidden instead, so that it can later be shown again without reconstructing it.

destroy-event (arg0 <gdk-event>) ⇒ <gboolean> [Signal on <gtk-widget>]
The ::destroy-event signal is emitted when a <gdk-window> is destroyed. You rarely get this signal, because most widgets disconnect themselves from their window before they destroy it, so no widget owns the window at destroy time.
Chapter 138: GtkWidget

expose-event (arg0 <gdk-event>) ⇒ <gboolean>  [Signal on <gtk-widget>]
key-press-event (arg0 <gdk-event>) ⇒ <gboolean>  [Signal on <gtk-widget>]
key-release-event (arg0 <gdk-event>)  ⇒ <gboolean>
enter-notify-event (arg0 <gdk-event>)  ⇒ <gboolean>
leave-notify-event (arg0 <gdk-event>)  ⇒ <gboolean>
configure-event (arg0 <gdk-event>) ⇒ <gboolean>
focus-in-event (arg0 <gdk-event>)  ⇒ <gboolean>
focus-out-event (arg0 <gdk-event>) ⇒ <gboolean>
map-event (arg0 <gdk-event>) ⇒ <gboolean>
unmap-event (arg0 <gdk-event>) ⇒ <gboolean>
property-notify-event (arg0 <gdk-event>)  ⇒ <gboolean>
selection-clear-event (arg0 <gdk-event>)  ⇒ <gboolean>
selection-request-event (arg0 <gdk-event>)  ⇒ <gboolean>
selection-notify-event (arg0 <gdk-event>)  ⇒ <gboolean>
selection-received (arg0 <gtk-selection-data>) (arg1 <guint>)
selection-get (arg0 <gtk-selection-data>) (arg1 <guint>) (arg2 <guint>)
proximity-in-event (arg0 <gdk-event>)  ⇒ <gboolean>
proximity-out-event (arg0 <gdk-event>)  ⇒ <gboolean>
drag-leave (arg0 <gdk-drag-context>) (arg1 <guint>)
The ::drag-leave signal is emitted on the drop site when the cursor leaves the widget. A typical reason to connect to this signal is to undo things done in ::drag-motion, e.g. undo highlighting with gtk-drag-unhighlight

drag-begin (arg0 <gdk-drag-context>) [Signal on <gtk-widget>]
The ::drag-begin signal is emitted on the drag source when a drag is started. A typical reason to connect to this signal is to set up a custom drag icon with gtk-drag-source-set-icon.
**drag-end** *(arg0 <gdk-drag-context>)*

The `::drag-end` signal is emitted on the drag source when a drag is finished. A typical reason to connect to this signal is to undo things done in ::drag-begin.

**drag-data-delete** *(arg0 <gdk-drag-context>)*

The `::drag-data-delete` signal is emitted on the drag source when a drag with the action ‘GDK_ACTION_MOVE’ is successfully completed. The signal handler is responsible for deleting the data that has been dropped. What "delete" means, depends on the context of the drag operation.

**drag-failed** *(arg0 <gdk-drag-context>)*

```c
static void
drag_motion (GtkWidget *widget,
             GdkDragContext *context,
             gint x,
             gint y,
             guint time)
{
    GdkAtom target;

    PrivateData *private_data = GET_PRIVATE_DATA (widget);

    if (!private_data->drag_highlight)
    {
        private_data->drag_highlight = 1;
        gtk_drag_highlight (widget);
    }
```
target = gtk_drag_dest_find_target (widget, context, NULL);
if (target == GDK_NONE)
gdk_drag_status (context, 0, time);
else
{
    private_data->pending_status = context->suggested_action;
gtk_drag_get_data (widget, context, target, time);
}
return TRUE;
}

static void
drag_data_received (GtkWidget *widget,
                    GdkDragContext *context,
                    gint x,
                    gint y,
                    GtkSelectionData *selection_data,
                    guint info,
                    guint time)
{
    PrivateData *private_data = GET_PRIVATE_DATA (widget);

    if (private_data->suggested_action)
    {
        private_data->suggested_action = 0;

        /* We are getting this data due to a request in drag_motion,
         * rather than due to a request in drag_drop, so we are just
         * supposed to call gdk_drag_status(), not actually paste in
         * the data.
         */
        str = gtk_selection_data_get_text (selection_data);
        if (!data_is_acceptable (str))
gdk_drag_status (context, 0, time);
        else
            gdk_drag_status (context, private_data->suggested_action, time);
    }
    else
    {
        /* accept the drop */
    }
}
The ::drag-drop signal is emitted on the drop site when the user drops the data onto the widget. The signal handler must determine whether the cursor position is in a drop zone or not. If it is not in a drop zone, it returns ‘#f’ and no further processing is necessary. Otherwise, the handler returns ‘#t’. In this case, the handler must ensure that gtk-drag-finish is called to let the source know that the drop is done. The call to gtk-drag-finish can be done either directly or in a ::drag-data-received handler which gets triggered by calling gtk-drop-get-data to receive the data for one or more of the supported targets.

The ::drag-data-get signal is emitted on the drag source when the drop site requests the data which is dragged. It is the responsibility of the signal handler to fill data with the data in the format which is indicated by info. See gtk-selection-data-set and gtk-selection-data-set-text.

The ::drag-data-received signal is emitted on the drop site when the dragged data has been received. If the data was received in order to determine whether the drop will be accepted, the handler is expected to call gdk-drag-status and not finish the drag. If the data was received in response to a ::drag-drop signal (and this is the last target to be received), the handler for this signal is expected to process the received data and then call gtk-drag-finish, setting the success parameter depending on whether the data was processed successfully.

The handler may inspect and modify drag-context->action before calling gtk-drag-finish, e.g. to implement ‘GDK_ACTION_ASK’ as shown in the following example:

```c
void
drag_data_received (GtkWidget *widget,
    GdkDragContext *drag_context,
    gint x,
    gint y,
    GtkSelectionData *data,
    guint info,
    guint time)
{
    if ((data->length >= 0) && (data->format == 8))
    {
        if (drag_context->action == GDK_ACTION_ASK)
        {
            GtkWidget *dialog;
            gint response;
```
dialog = gtk_message_dialog_new (NULL,
GTK_DIALOG_MODAL |
GTK_DIALOG_DESTROY_WITH_PARENT,
GTK_MESSAGE_INFO,
GTK_BUTTONS_YES_NO,
"Move the data ?\n"
);
response = gtk_dialog_run (GTK_DIALOG (dialog));
gtk_widget_destroy (dialog);

if (response == GTK_RESPONSE_YES)
    drag_context->action = GDK_ACTION_MOVE;
else
    drag_context->action = GDK_ACTION_COPY;
}
gtk_drag_finish (drag_context, TRUE, FALSE, time);
return;
}
gtk_drag_finish (drag_context, FALSE, FALSE, time);

visibility-notify-event (arg0 <gdk-event>) ⇒ <gboolean>          [Signal on <gtk-widget>]
client-event (arg0 <gdk-event>) ⇒ <gboolean>                      [Signal on <gtk-widget>]
no-expose-event (arg0 <gdk-event>) ⇒ <gboolean>                   [Signal on <gtk-widget>]
window-state-event (arg0 <gdk-event>) ⇒ <gboolean>                [Signal on <gtk-widget>]

grab-broken-event (arg0 <gdk-event>) ⇒ <gboolean>                [Signal on <gtk-widget>]

Emitted when a pointer or keyboard grab on a window belonging to widget gets broken.
On X11, this happens when the grab window becomes unviewable (i.e. it or one of its ancestors is unmapped), or if the same application grabs the pointer or keyboard again.
Since 2.8

query-tooltip (arg0 <gint>) (arg1 <gint>)
    (arg2 <gboolean>) (arg3 <gtk-tooltip>) ⇒ <gboolean>
undocumented

popup-menu ⇒ <gboolean>                       [Signal on <gtk-widget>]
This signal gets emitted whenever a widget should pop up a context-sensitive menu.
This usually happens through the standard key binding mechanism; by pressing a certain key while a widget is focused, the user can cause the widget to pop up a menu.
For example, the <gtk-entry> widget creates a menu with clipboard commands. See (the missing figure, checklist-popup-menu for an example of how to use this signal.
show-help (arg0 <gtk-widget-help-type>)  ⇒ <gboolean>

accel-closures-changed  ⇒ <gboolean>

screen-changed (arg0 <gdk-screen>)  ⇒ <gboolean>

Determines whether an accelerator that activates the signal identified by signal-id can currently be activated. This signal is present to allow applications and derived widgets to override the default <gtk-widget> handling for determining whether an accelerator can be activated.

<gtk-requisition>

This class defines no direct slots.

<Class>

<gtk-selection-data>

This class defines no direct slots.

<Class>

gtk-widget-destroy (self <gtk-widget>)  ⇒ <void>

Destroys a widget. Equivalent to gtk-object-destroy, except that you don’t have to cast the widget to <gtk-object>. When a widget is destroyed, it will break any references it holds to other objects. If the widget is inside a container, the widget will be removed from the container. If the widget is a toplevel (derived from <gtk-window>), it will be removed from the list of toplevels, and the reference GTK+ holds to it will be removed. Removing a widget from its container or the list of toplevels results in the widget being finalized, unless you’ve added additional references to the widget with g-object-ref.

In most cases, only toplevel widgets (windows) require explicit destruction, because when you destroy a toplevel its children will be destroyed as well.

gtk-widget-unparent (self <gtk-widget>)  ⇒ <void>

This function is only for use in widget implementations. Should be called by implementations of the remove method on <gtk-container>, to dissociate a child from the container.

gtk-widget-show (self <gtk-widget>)  ⇒ <void>

Flags a widget to be displayed. Any widget that isn’t shown will not appear on the screen. If you want to show all the widgets in a container, it’s easier to call gtk-widget-show-all on the container, instead of individually showing the widgets.

Remember that you have to show the containers containing a widget, in addition to the widget itself, before it will appear onscreen.
When a toplevel container is shown, it is immediately realized and mapped; other shown widgets are realized and mapped when their toplevel container is realized and mapped.

```python
widget     a <gtk-widget>
```

```c
gtk-widget-show-now (self <gtk-widget>)
```

**Function**

**Method**

Shows a widget. If the widget is an unmapped toplevel widget (i.e. a `<gtk-window>` that has not yet been shown), enter the main loop and wait for the window to actually be mapped. Be careful; because the main loop is running, anything can happen during this function.

```python
widget     a <gtk-widget>
```

```c
gtk-widget-hide (self <gtk-widget>)
```

**Function**

**Method**

Reverses the effects of `gtk-widget-show`, causing the widget to be hidden (invisible to the user).

```python
widget     a <gtk-widget>
```

```c
gtk-widget-show-all (self <gtk-widget>)
```

**Function**

**Method**

Recursively shows a widget, and any child widgets (if the widget is a container).

```python
widget     a <gtk-widget>
```

```c
gtk-widget-hide-all (self <gtk-widget>)
```

**Function**

**Method**

Recursively hides a widget and any child widgets.

```python
widget     a <gtk-widget>
```

```c
gtk-widget-map (self <gtk-widget>)
```

**Function**

**Method**

This function is only for use in widget implementations. Causes a widget to be mapped if it isn’t already.

```python
widget     a <gtk-widget>
```

```c
gtk-widget-unmap (self <gtk-widget>)
```

**Function**

**Method**

This function is only for use in widget implementations. Causes a widget to be unmapped if it’s currently mapped.

```python
widget     a <gtk-widget>
```

```c
gtk-widget-realize (self <gtk-widget>)
```

**Function**

**Method**

Creates the GDK (windowing system) resources associated with a widget. For example, `widget->window` will be created when a widget is realized. Normally realization
happens implicitly; if you show a widget and all its parent containers, then the widget
will be realized and mapped automatically.

Realizing a widget requires all the widget’s parent widgets to be realized; calling `gtk-
widget-realize` realizes the widget’s parents in addition to `widget` itself. If a widget
is not yet inside a toplevel window when you realize it, bad things will happen.
This function is primarily used in widget implementations, and isn’t very useful oth-
wise. Many times when you think you might need it, a better approach is to
connect to a signal that will be called after the widget is realized automatically, such
as "expose_event". Or simply `g-signal-connect-after` to the "realize" signal.

```c
// gtk-widget-unrealize
void gtk-widget-unrealize (GObject *object, gpointer user_data);

// gtk-widget-queue-draw
void gtk-widget-queue-draw (GObject *object, gpointer user_data);

// gtk-widget-queue-resize
void gtk-widget-queue-resize (GObject *object, gpointer user_data);

// gtk-widget-queue-resize-no-redraw
void gtk-widget-queue-resize-no-redraw (GObject *object, gpointer user_data);

// gtk-widget-size-request
void gtk-widget-size-request (GObject *object, gpointer user_data);
```

This function is only useful in widget implementations. Causes a widget to be unre-
alized (frees all GDK resources associated with the widget, such as `widget->window`).

Equivalent to calling `gtk-widget-queue-draw-area` for the entire area of a widget.

This function is only for use in widget implementations. Flags a widget to have its
size renegotiated; should be called when a widget for some reason has a new size
request. For example, when you change the text in a `<gtk-label>`, `<gtk-label>`
queues a resize to ensure there’s enough space for the new text.

This function works like `gtk-widget-queue-resize`, except that the widget is not
invalidated.

Since 2.4

This function is typically used when implementing a `<gtk-container>` subclass. Ob-
tains the preferred size of a widget. The container uses this information to arrange its
child widgets and decide what size allocations to give them with `gtk-widget-size-
allocate`.
You can also call this function from an application, with some caveats. Most notably, getting a size request requires the widget to be associated with a screen, because font information may be needed. Multihead-aware applications should keep this in mind. Also remember that the size request is not necessarily the size a widget will actually be allocated.

See also gtk-widget-get-child-requisition.

```python
widget a <gtk-widget>
requisition a <gtk-requisition> to be filled in

gtk-widget-get-child-requisition (self <gtk-widget>) [Function]
  (requisition <gtk-requisition>)

get-child-requisition [Method]

This function is only for use in widget implementations. Obtains widget->requisition, unless someone has forced a particular geometry on the widget (e.g. with gtk-widget-set-usize), in which case it returns that geometry instead of the widget’s requisition.

This function differs from gtk-widget-size-request in that it retrieves the last size request value from widget->requisition, while gtk-widget-size-request actually calls the "size_request" method on widget to compute the size request and fill in widget->requisition, and only then returns widget->requisition.

Because this function does not call the "size_request" method, it can only be used when you know that widget->requisition is up-to-date, that is, gtk-widget-size-request has been called since the last time a resize was queued. In general, only container implementations have this information; applications should use gtk-widget-size-request.

```python
widget a <gtk-widget>
requisition a <gtk-requisition> to be filled in

gtk-widget-size-allocate (self <gtk-widget>) [Function]
  (allocation <gdk-rectangle>)

size-allocate [Method]

This function is only used by <gtk-container> subclasses, to assign a size and position to their child widgets.

```python
widget a <gtk-widget>
allocation position and size to be allocated to widget

gtk-widget-add-accelerator (self <gtk-widget>) [Function]
  (accel_signal mchars) (accel_group <gtk-accel-group>)
  (accel_key unsigned-int) (accel_mods <gdk-modifier-type>)
  (accel_flags <gtk-accel-flags>)

add-accelerator [Method]

Installs an accelerator for this widget in accel-group that causes accel-signal to be emitted if the accelerator is activated. The accel-group needs to be added to the widget’s toplevel via gtk-window-add-accel-group, and the signal must be of type
```
‘G_RUN_ACTION’. Accelerators added through this function are not user changeable during runtime. If you want to support accelerators that can be changed by the user, use gtk-accel-map-add-entry and gtk-widget-set-accel-path or gtk-menu-item-set-accel-path instead.

```c
widget widget to install an accelerator on
accel-signal widget signal to emit on accelerator activation
accel-group accel group for this widget, added to its toplevel
accel-key GDK keyval of the accelerator
accel-mods modifier key combination of the accelerator
accel-flags flag accelerators, e.g. ‘GTK_ACCEL_VISIBLE’
```

### gtk-widget-remove-accelerator

```c
self <gtk-widget>
(accel_group <gtk-accel-group>) (accel_key unsigned-int)
(accel_mods <gdk-modifier-type>) ⇒ (ret bool)
```

**remove-accelerator**

Removes an accelerator from *widget*, previously installed with gtk-widget-add-accelerator.

- **widget**: widget to install an accelerator on
- **accel-group**: accel group for this widget
- **accel-key**: GDK keyval of the accelerator
- **accel-mods**: modifier key combination of the accelerator
- **ret**: whether an accelerator was installed and could be removed

### gtk-widget-set-accel-path

```c
self <gtk-widget>
(accel_path mchars) (accel_group <gtk-accel-group>)
```

**set-accel-path**

Given an accelerator group, *accel-group*, and an accelerator path, *accel-path*, sets up an accelerator in *accel-group* so whenever the key binding that is defined for *accel-path* is pressed, *widget* will be activated. This removes any accelerators (for any accelerator group) installed by previous calls to gtk-widget-set-accel-path. Associating accelerators with paths allows them to be modified by the user and the modifications to be saved for future use. (See gtk-accel-map-save.)

This function is a low level function that would most likely be used by a menu creation system like <gtk-item-factory>. If you use <gtk-item-factory>, setting up accelerator paths will be done automatically.

Even when you you aren’t using <gtk-item-factory>, if you only want to set up accelerators on menu items gtk-menu-item-set-accel-path provides a somewhat more convenient interface.
widget  a `<gtk-widget>`

accel-path  path used to look up the accelerator

accel-group  a `<gtk-accel-group>`.

gtk-widget-list-accel-closures (self `<gtk-widget>`)  [Function]
⇒ (ret glist-of)
list-accel-closures  [Method]
Lists the closures used by widget for accelerator group connections with `gtk-accel-group-connect-by-path` or `gtk-accel-group-connect`. The closures can be used to monitor accelerator changes on widget, by connecting to the ::accel_changed signal of the `<gtk-accel-group>` of a closure which can be found out with `gtk-accel-group-from-accel-closure`.

widget  widget to list accelerator closures for
ret  a newly allocated `<g-list>` of closures

gtk-widget-can-activate-accel (self `<gtk-widget>`)  (signal_id unsigned-int) ⇒ (ret bool)
can-activate-accel  [Method]
Determines whether an accelerator that activates the signal identified by `signal_id` can currently be activated. This is done by emitting the GtkWidget::can-activate-accel signal on widget; if the signal isn’t overridden by a handler or in a derived widget, then the default check is that the widget must be sensitive, and the widget and all its ancestors mapped.

widget  a `<gtk-widget>`
signal-id  the ID of a signal installed on widget
ret  `#t` if the accelerator can be activated.

Since 2.4

gtk-widget-event (self `<gtk-widget>`) (event `<gdk-event>`)  [Function]
⇒ (ret bool)
event  [Method]
Rarely-used function. This function is used to emit the event signals on a widget (those signals should never be emitted without using this function to do so). If you want to synthesize an event though, don’t use this function; instead, use `gdk-main-do-event` so the event will behave as if it were in the event queue. Don’t synthesize expose events; instead, use `gdk-window-invalidate-rect` to invalidate a region of the window.

widget  a `<gtk-widget>`
event  a `<gdk-event>`
ret  return from the event signal emission (`#t` if the event was handled)
gtk-widget-activate (self <gtk-widget>) ⇒ (ret bool)  [Function]
activate  [Method]
For widgets that can be "activated" (buttons, menu items, etc.) this function activates them. Activation is what happens when you press Enter on a widget during key navigation. If widget isn’t activatable, the function returns ‘#f’.

widget  a <gtk-widget> that’s activatable
ret  ‘#t’ if the widget was activatable

gtk-widget-reparent (self <gtk-widget>)  [Function]
reparent  [Method]
Moves a widget from one <gtk-container> to another, handling reference count issues to avoid destroying the widget.

widget  a <gtk-widget>
new-parent
a <gtk-container> to move the widget into

gtk-widget-is-focus (self <gtk-widget>) ⇒ (ret bool)  [Function]
is-focus  [Method]
Determines if the widget is the focus widget within its toplevel. (This does not mean that the ‘HAS_FOCUS’ flag is necessarily set; ‘HAS_FOCUS’ will only be set if the toplevel widget additionally has the global input focus.)

widget  a <gtk-widget>
ret  ‘#t’ if the widget is the focus widget.

gtk-widget-grab-focus (self <gtk-widget>)  [Function]
grab-focus  [Method]
Causes widget to have the keyboard focus for the <gtk-window> it’s inside. widget must be a focusable widget, such as a <gtk-entry>; something like <gtk-frame> won’t work. (More precisely, it must have the ‘GTK_CAN_FOCUS’ flag set.)

widget  a <gtk-widget>

gtk-widget-grab-default (self <gtk-widget>)  [Function]
grab-default  [Method]
Causes widget to become the default widget. widget must have the ‘GTK_CAN_DEFAULT’ flag set; typically you have to set this flag yourself by calling ‘GTK_WIDGET_SET_FLAGS (widget, GTK_CAN_DEFAULT)’. The default widget is activated when the user presses Enter in a window. Default widgets must be activatable, that is, gtk-widget-activate should affect them.

widget  a <gtk-widget>

gtk-widget-set-name (self <gtk-widget>) (name mchars)  [Function]
set-name  [Method]
Widgets can be named, which allows you to refer to them from a gtkrc file. You can apply a style to widgets with a particular name in the gtkrc file. See the documentation for gtkrc files (on the same page as the docs for <gtk-rc-style>).
Note that widget names are separated by periods in paths (see `gtk-widget-path`), so names with embedded periods may cause confusion.

```python
widget a <gtk-widget>
name name for the widget
```

**Function**: `gtk-widget-get-name` (`self <gtk-widget>`) ⇒ (`ret mchars`)  
**Method**: `get-name`  
Retrieves the name of a widget. See `gtk-widget-set-name` for the significance of widget names.

```python
widget a <gtk-widget>
ret name of the widget. This string is owned by GTK+ and should not be modified or freed
```

**Function**: `gtk-widget-set-state` (`self <gtk-widget>`) (state `gtk-state-type`)  
**Method**: `set-state`  
This function is for use in widget implementations. Sets the state of a widget (insensitive, prelighted, etc.) Usually you should set the state using wrapper functions such as `gtk-widget-set-sensitive`.

```python
widget a <gtk-widget>
state new state for widget
```

**Function**: `gtk-widget-set-sensitive` (`self <gtk-widget>`) (sensitive `bool`)  
**Method**: `set-sensitive`  
Sets the sensitivity of a widget. A widget is sensitive if the user can interact with it. Insensitive widgets are "grayed out" and the user can’t interact with them. Insensitive widgets are known as "inactive", "disabled", or "ghosted" in some other toolkits.

```python
widget a <gtk-widget>
sensitive ‘#t’ to make the widget sensitive
```

**Function**: `gtk-widget-set-parent` (`self <gtk-widget>`) (parent `<gtk-widget>`)  
**Method**: `set-parent`  
This function is useful only when implementing subclasses of `<gtk-container>`. Sets the container as the parent of `widget`, and takes care of some details such as updating the state and style of the child to reflect its new location. The opposite function is `gtk-widget-unparent`.

```python
widget a <gtk-widget>
pARENT parent container
```

**Function**: `gtk-widget-set-parent-window` (`self <gtk-widget>`) (parent_window `<gdk-window>`)  
**Method**: `set-parent-window`  
Sets a non default parent window for `widget`.

```python
widget a <gtk-widget>.
```
Chapter 138: GtkWidget

parent-window
the new parent window.

gtk-widget-get-parent-window (self <gtk-widget>) ⇒ (ret <gdk-window>)
get-parent-window
Gets widget's parent window.

widget  a <gtk-widget>.
ret  the parent window of widget.

gtk-widget-set-events (self <gtk-widget>)
set-events
Sets the event mask (see <gdk-event-mask>) for a widget. The event mask determines which events a widget will receive. Keep in mind that different widgets have different default event masks, and by changing the event mask you may disrupt a widget's functionality, so be careful. This function must be called while a widget is unrealized. Consider gtk-widget-add-events for widgets that are already realized, or if you want to preserve the existing event mask. This function can't be used with <gtk-no-window> widgets; to get events on those widgets, place them inside a <gtk-event-box> and receive events on the event box.

widget  a <gtk-widget>

events  an event mask

gtk-widget-add-events (self <gtk-widget>)
add-events
Adds the events in the bitfield events to the event mask for widget. See gtk-widget-set-events for details.

widget  a <gtk-widget>

events  an event mask, see <gdk-event-mask>

gtk-widget-set-extension-events (self <gtk-widget>)
set-extension-events
Sets the extension events mask to mode. See <gdk-extension-mode> and gdk-input-set-extension-events.

widget  a <gtk-widget>

mode  bitfield of extension events to receive

gtk-widget-get-extension-events (self <gtk-widget>) ⇒ (ret <gdk-extension-mode>)
get-extension-events
Retrieves the extension events the widget will receive; see gdk-input-set-extension-events.
GtkWidget *toplevel = gtk_widget_get_toplevel (widget);
if (GTK_WIDGET_TOPLEVEL (toplevel))
{
    [ Perform action on toplevel. ]
}

widget a <gtk-widget>
ret the topmost ancestor of widget, or widget itself if there’s no ancestor.

gtk-widget-get-ancestor (self <gtk-widget>) (widget_type <gtype>) ⇒ (ret <gtk-widget>)
get-ancestor

Gets the first ancestor of widget with type widget-type. For example, ‘gtk_widget_get_ancestor (widget, GTK_TYPE_BOX)’ gets the first <gtk-box> that’s an ancestor of widget. No reference will be added to the returned widget; it should not be unreferenced. See note about checking for a toplevel <gtk-window> in the docs for gtk-widget-get-toplevel.

Note that unlike gtk-widget-is-ancestor, gtk-widget-get-ancestor considers widget to be an ancestor of itself.

widget a <gtk-widget>
widget-type ancestor type
ret the ancestor widget, or ‘#f’ if not found

gtk-widget-get-colormap (self <gtk-widget>) ⇒ (ret <gdk-colormap>)
get-colormap

Gets the colormap that will be used to render widget. No reference will be added to the returned colormap; it should not be unreferenced.
widget  a <gtk-widget>
ret  the colormap used by widget

```c
gtk-widget-set-colormap (self <gtk-widget>) (colormap <gdk-colormap>)
```

**set-colormap**

Sets the colormap for the widget to the given value. Widget must not have been previously realized. This probably should only be used from an init function (i.e. from the constructor for the widget).

```c
gtk-widget-get-visual (self <gtk-widget>) ⇒ (ret <gdk-visual>)
```

**get-visual**

Gets the visual that will be used to render widget.

```c
gtk-widget-get-events (self <gtk-widget>) ⇒ (ret int)
```

**get-events**

Returns the event mask for the widget (a bitfield containing flags from the <gdk-event-mask> enumeration). These are the events that the widget will receive.

```c
gtk-widget-get-pointer (self <gtk-widget>) ⇒ (x int) (y int)
```

**get-pointer**

Obtains the location of the mouse pointer in widget coordinates. Widget coordinates are a bit odd; for historical reasons, they are defined as widget->window coordinates for widgets that are not <gtk-no-window> widgets, and are relative to widget->allocation.x, widget->allocation.y for widgets that are <gtk-no-window> widgets.

```c
gtk-widget-is-ancestor (self <gtk-widget>) (ancestor <gtk-widget>) ⇒ (ret bool)
```

**is-ancestor**

Determines whether widget is somewhere inside ancestor, possibly with intermediate containers.

```c
widget  a <gtk-widget>
ancestor  another <gtk-widget>
```

ret  ‘#t’ if ancestor contains widget as a child, grandchild, great grandchild, etc.
Chapter 138: GtkWidget

**gtk-widget-translate-coordinates** ([Function])

```
(self <gtk-widget>) (dest-widget <gtk-widget>) (src-x int) (src-y int) ⇒ (ret bool)
```

**translate-coordinates** ([Method])

Translate coordinates relative to `src-widget`'s allocation to coordinates relative to `dest-widget`'s allocations. In order to perform this operation, both widgets must be realized, and must share a common toplevel.

- `src-widget` a `<gtk-widget>`
- `dest-widget` a `<gtk-widget>`
- `src-x` X position relative to `src-widget`
- `src-y` Y position relative to `src-widget`
- `dest-x` location to store X position relative to `dest-widget`
- `dest-y` location to store Y position relative to `dest-widget`
- `ret` `'#f'` if either widget was not realized, or there was no common ancestor. In this case, nothing is stored in `*dest-x` and `*dest-y`. Otherwise `'#t'`.

**gtk-widget-hide-on-delete** ([Function])

```
hide-on-delete (self <gtk-window>) ⇒ (ret bool)
```

**hide-on-delete** ([Method])

Utility function; intended to be connected to the "delete-event" signal on a `<gtk-window>`. The function calls `gtk-widget-hide` on its argument, then returns `'#t'`. If connected to "delete-event", the result is that clicking the close button for a window (on the window frame, top right corner usually) will hide but not destroy the window. By default, GTK+ destroys windows when "delete-event" is received.

- `widget` a `<gtk-widget>`
- `ret` `'#t'`

**gtk-widget-set-style** ([Function])

```
set-style (self <gtk-window>) (style <gtk-style>)
```

**set-style** ([Method])

Sets the `<gtk-style>` for a widget (widget->style). You probably don’t want to use this function; it interacts badly with themes, because themes work by replacing the `<gtk-style>`. Instead, use `gtk-widget-modify-style`.

- `widget` a `<gtk-widget>`
- `style` a `<gtk-style>`, or `'#f'` to remove the effect of a previous `gtk-widget-set-style` and go back to the default style

**gtk-widget-ensure-style** ([Function])

```
ensure-style (self <gtk-window>)
```

**ensure-style** ([Method])

Ensures that `widget` has a style (widget->style). Not a very useful function; most of the time, if you want the style, the widget is realized, and realized widgets are guaranteed to have a style already.
**gtk-widget-get-style** *(self <gtk-widget>)* ⇒ *(ret <gtk-style>)*  
Simply an accessor function that returns *widget->style*.

*widget*  a <gtk-widget>

*ret*  the widget’s <gtk-style>

**gtk-widget-reset-rc-styles** *(self <gtk-widget>)*  
Reset the styles of *widget* and all descendents, so when they are looked up again, they get the correct values for the currently loaded RC file settings.

This function is not useful for applications.

*widget*  a <gtk-widget>

**gtk-widget-push-colormap** *(cmap <gdk-colormap>)*  
Pushes *cmap* onto a global stack of colormaps; the topmost colormap on the stack will be used to create all widgets. Remove *cmap* with **gtk-widget-pop-colormap**. There’s little reason to use this function.

*cmap*  a <gdk-colormap>

**gtk-widget-pop-colormap**  
Removes a colormap pushed with **gtk-widget-push-colormap**.

**gtk-widget-set-default-colormap** *(colormap <gdk-colormap>)*  
Sets the default colormap to use when creating widgets. **gtk-widget-push-colormap** is a better function to use if you only want to affect a few widgets, rather than all widgets.

*colormap*  a <gdk-colormap>

**gtk-widget-get-default-style** ⇒ *(ret <gtk-style>)*  
Returns the default style used by all widgets initially.

*ret*  the default style. This <gtk-style> object is owned by GTK+ and should not be modified or freed.

**gtk-widget-get-default-colormap** ⇒ *(ret <gdk-colormap>)*  
Obtains the default colormap used to create widgets.

*ret*  default widget colormap

**gtk-widget-get-default-visual** ⇒ *(ret <gdk-visual>)*  
Obtains the visual of the default colormap. Not really useful; used to be useful before gdk-colormap-get-visual existed.

*ret*  visual of the default colormap

**gtk-widget-set-direction** *(self <gtk-widget>)*  
Sets the reading direction on a particular widget. This direction controls the primary direction for widgets containing text, and also the direction in which the children
of a container are packed. The ability to set the direction is present in order so that correct localization into languages with right-to-left reading directions can be done. Generally, applications will let the default reading direction present, except for containers where the containers are arranged in an order that is explicitly visual rather than logical (such as buttons for text justification).

If the direction is set to ‘GTK_TEXT_DIR_NONE’, then the value set by `gtk-widget-set-default-direction` will be used.

```python
widget a <gtk-widget>

(dir the new direction

gtk-widget-get-direction (self <gtk-widget>) [Function]
⇒ (ret <gtk-text-direction>)
get-direction [Method]
Gets the reading direction for a particular widget. See `gtk-widget-set-direction`.

widget a <gtk-widget>
ret the reading direction for the widget.

gtk-widget-set-default-direction (dir <gtk-text-direction>) [Function]
Sets the default reading direction for widgets where the direction has not been explicitly set by `gtk-widget-set-direction`.

dir the new default direction. This cannot be ‘GTK_TEXT_DIR_NONE’.

gtk-widget-get-default-direction [Function]
⇒ (ret <gtk-text-direction>)
Obtains the current default reading direction. See `gtk-widget-set-default-direction`.

ret the current default direction.

gtk-widget-shape-combine-mask (self <gtk-widget>) [Function]
(shape-mask gdk-drawable) (offset_x int) (offset_y int)
shape-combine-mask [Method]
Sets a shape for this widget’s GDK window. This allows for transparent windows etc., see `gdk-window-shape-combine-mask` for more information.

widget a <gtk-widget>.
shape-mask shape to be added, or ‘#f’ to remove an existing shape.
offset-x X position of shape mask with respect to window.
offset-y Y position of shape mask with respect to window.

gtk-widget-input-shape-combine-mask (self <gtk-widget>) [Function]
(shape-mask gdk-drawable) (offset_x int) (offset_y int)
input-shape-combine-mask [Method]
Sets an input shape for this widget’s GDK window. This allows for windows which react to mouse click in a nonrectangular region, see `gdk-window-input-shape-combine-mask` for more information.
Chapter 138: GtkWidget

widget a `<gtk-widget>`.

shape-mask
shape to be added, or `'#f' to remove an existing shape.

offset-x X position of shape mask with respect to window.

offset-y Y position of shape mask with respect to window.

Since 2.10

gtk-widget-path (self `<gtk-widget>`) [Function]
⇒ (path_length unsigned-int) (path mchars) (path-reversed mchars)

path
Obtains the full path to widget. The path is simply the name of a widget and all its parents in the container hierarchy, separated by periods. The name of a widget comes from gtk-widget-get-name. Paths are used to apply styles to a widget in gtkrc configuration files. Widget names are the type of the widget by default (e.g. "GtkButton") or can be set to an application-specific value with gtk-widget-set-name. By setting the name of a widget, you allow users or theme authors to apply styles to that specific widget in their gtkrc file. path-reversed-p fills in the path in reverse order, i.e. starting with widget’s name instead of starting with the name of widget’s outermost ancestor.

widget a `<gtk-widget>`

path-length
location to store length of the path, or `'#f'

path
location to store allocated path string, or `'#f'

path-reversed
location to store allocated reverse path string, or `'#f'

gtk-widget-class-path (self `<gtk-widget>`) [Function]
⇒ (path_length unsigned-int) (path mchars) (path-reversed mchars)

class-path [Method]
Same as gtk-widget-path, but always uses the name of a widget’s type, never uses a custom name set with gtk-widget-set-name.

widget a `<gtk-widget>`

path-length
location to store the length of the class path, or `'#f'

path
location to store the class path as an allocated string, or `'#f'

path-reversed
location to store the reverse class path as an allocated string, or `'#f'

gtk-widget-get-composite-name (self `<gtk-widget>`) [Function]
⇒ (ret mchars)

get-composite-name [Method]
Obtains the composite name of a widget.
widget a `<gtk-widget>`.
ret the composite name of widget, or ‘#f’ if widget is not a composite child. The string should not be freed when it is no longer needed.

**gtk-widget-modify-style** *(self `<gtk-widget>`)*  
*style `<gtk-rc-style>`*  

**modify-style**  
Modifies style values on the widget. Modifications made using this technique take precedence over style values set via an RC file, however, they will be overridden if a style is explicitly set on the widget using `gtk-widget-set-style`. The `<gtk-rc-style>` structure is designed so each field can either be set or unset, so it is possible, using this function, to modify some style values and leave the others unchanged.

Note that modifications made with this function are not cumulative with previous calls to `gtk-widget-modify-style` or with such functions as `gtk-widget-modify-fg`. If you wish to retain previous values, you must first call `gtk-widget-get-modifier-style`, make your modifications to the returned style, then call `gtk-widget-modify-style` with that style. On the other hand, if you first call `gtk-widget-modify-style`, subsequent calls to such functions `gtk-widget-modify-fg` will have a cumulative effect with the initial modifications.

widget a `<gtk-widget>`
style the `<gtk-rc-style>` holding the style modifications

**gtk-widget-get-modifier-style** *(self `<gtk-widget>`)*  
⇒ *(ret `<gtk-rc-style>`)*  

**get-modifier-style**  
Returns the current modifier style for the widget. (As set by `gtk-widget-modify-style`.) If no style has previously set, a new `<gtk-rc-style>` will be created with all values unset, and set as the modifier style for the widget. If you make changes to this rc style, you must call `gtk-widget-get-modifier-style`, passing in the returned rc style, to make sure that your changes take effect.

Caution: passing the style back to `gtk-widget-modify-style` will normally end up destroying it, because `gtk-widget-modify-style` copies the passed-in style and sets the copy as the new modifier style, thus dropping any reference to the old modifier style. Add a reference to the modifier style if you want to keep it alive.

widget a `<gtk-widget>`
ret the modifier style for the widget. This rc style is owned by the widget. If you want to keep a pointer to value this around, you must add a refcount using `g-object-ref`.

**gtk-widget-modify-fg** *(self `<gtk-widget>`)*  
*state `<gtk-state-type>`* *(color `<gdk-color>`)*  

**modify-fg**  
Sets the foreground color for a widget in a particular state. All other style values are left untouched. See also `gtk-widget-modify-style`.

widget a `<gtk-widget>`.
Chapter 138: GtkWidget 550

state the state for which to set the foreground color.
color the color to assign (does not need to be allocated), or ‘#f’ to undo the effect of previous calls to of gtk-widget-modify-fg.

**gtk-widget-modify-bg** *(self <gtk-widget>)*

*(state <gtk-state-type>)*(color <gdk-color>)*

**modify-bg**

Sets the background color for a widget in a particular state. All other style values are left untouched. See also **gtk-widget-modify-style**.

Note that "no window" widgets (which have the ‘GTK_NO_WINDOW’ flag set) draw on their parent container’s window and thus may not draw any background themselves. This is the case for e.g. `<gtk-label>`. To modify the background of such widgets, you have to set the background color on their parent; if you want to set the background of a rectangular area around a label, try placing the label in a `<gtk-event-box>` widget and setting the background color on that.

**gtk-widget-modify-text** *(self <gtk-widget>)*

*(state <gtk-state-type>)*(color <gdk-color>)*

**modify-text**

Sets the text color for a widget in a particular state. All other style values are left untouched. The text color is the foreground color used along with the base color (see **gtk-widget-modify-base** for widgets such as `<gtk-entry>` and `<gtk-text-view>`).

See also **gtk-widget-modify-style**.

**gtk-widget-modify-base** *(self <gtk-widget>)*

*(state <gtk-state-type>)*(color <gdk-color>)*

**modify-base**

Sets the base color for a widget in a particular state. All other style values are left untouched. The base color is the background color used along with the text color (see **gtk-widget-modify-text** for widgets such as `<gtk-entry>` and `<gtk-text-view>`).

See also **gtk-widget-modify-style**.

Note that "no window" widgets (which have the ‘GTK_NO_WINDOW’ flag set) draw on their parent container’s window and thus may not draw any background themselves. This is the case for e.g. `<gtk-label>`. To modify the background of such widgets, you have to set the base color on their parent; if you want to set the background of a rectangular area around a label, try placing the label in a `<gtk-event-box>` widget and setting the base color on that.
Chapter 138: GtkWidget

widget a `<gtk-widget>`.

state the state for which to set the base color.

color the color to assign (does not need to be allocated), or `#f` to undo the effect of previous calls to of `gtk-widget-modify-base`.

gtk-widget-modify-font (self `<gtk-widget>`) [Function]
  (font-desc `<pango-font-description>`) [Method]

Sets the font to use for a widget. All other style values are left untouched. See also `gtk-widget-modify-style`.

widget a `<gtk-widget>`

font-desc the font description to use, or `#f` to undo the effect of previous calls to `gtk-widget-modify-font`.

gtk-widget-create-pango-context (self `<gtk-widget>`) [Function]
  ⇒ (ret `<pango-context>`) [Method]

Creates a new `<pango-context>` with the appropriate font map, font description, and base direction for drawing text for this widget. See also `gtk-widget-get-pango-context`.

widget a `<gtk-widget>`

ret the new `<pango-context>`

gtk-widget-get-pango-context (self `<gtk-widget>`) [Function]
  ⇒ (ret `<pango-context>`) [Method]

 Gets a `<pango-context>` with the appropriate font map, font description, and base direction for this widget. Unlike the context returned by `gtk-widget-create-pango-context`, this context is owned by the widget (it can be used until the screen for the widget changes or the widget is removed from its toplevel), and will be updated to match any changes to the widget’s attributes.

If you create and keep a `<pango-layout>` using this context, you must deal with changes to the context by calling `pango-layout-context-changed` on the layout in response to the ::style-set and ::direction-changed signals for the widget.

widget a `<gtk-widget>`

ret the `<pango-context>` for the widget.

gtk-widget-create-pango-layout (self `<gtk-widget>`) [Function]
  (text mchars) ⇒ (ret `<pango-layout>`) [Method]

Creates a new `<pango-layout>` with the appropriate font map, font description, and base direction for drawing text for this widget.

If you keep a `<pango-layout>` created in this way around, in order to notify the layout of changes to the base direction or font of this widget, you must call `pango-layout-context-changed` in response to the ::style-set and ::direction-changed signals for the widget.
**gtk-widget-render-icon**

Function

\[
\text{gtk-widget-render-icon } (\text{self} \ a \ <\text{gtk-widget}> \ ) \ (\text{stock_id} \ mchars) \ \Rightarrow \ (\text{ret} \ <\text{gdk-pixbuf}>)
\]

**render-icon**

Method

A convenience function that uses the theme engine and RC file settings for widget to look up stock-id and render it to a pixbuf. stock-id should be a stock icon ID such as <gtk-stock-open> or <gtk-stock-ok>. size should be a size such as <gtk-icon-size-menu>. detail should be a string that identifies the widget or code doing the rendering, so that theme engines can special-case rendering for that widget or code.

The pixels in the returned <gdk-pixbuf> are shared with the rest of the application and should not be modified. The pixbuf should be freed after use with g-object-unref.

**gtk-widget-pop-composite-child**

Function

Cancels the effect of a previous call to gtk-widget-push-composite-child.

**gtk-widget-push-composite-child**

Function

Makes all newly-created widgets as composite children until the corresponding gtk-widget-pop-composite-child call.

A composite child is a child that’s an implementation detail of the container it’s inside and should not be visible to people using the container. Composite children aren’t treated differently by GTK (but see gtk-container-foreach vs. gtk-container forall), but e.g. GUI builders might want to treat them in a different way.

Here is a simple example:

```c
#include <gdk/pixbuf.h>
#include <gtk/gtk.h>

GtkWidget *scrolled_window;

gtkwgidget_push_composite_child ();
scrolled_window = gtk_hscrollbar_new (hadjustment);
gtk_widget_set_composite_name (scrolled_window, "hscrollbar");
gtk_widget_pop_composite_child ();
gtk_widget_set_parent (scrolled_window->hscrollbar, GTK_WIDGET (scrolled_window));
g_object_ref (scrolled_window->hscrollbar);
```
Chapter 138: GtkWidget

GtkWidget-queue-draw-area (self <gtk-widget>) (x int) (y int) (width int) (height int)

queue-draw-area
Invalidate the rectangular area of widget defined by x, y, width and height by calling gdk-window-invalidate-rect on the widget’s window and all its child windows. Once the main loop becomes idle (after the current batch of events has been processed, roughly), the window will receive expose events for the union of all regions that have been invalidated.

Normally you would only use this function in widget implementations. You might also use it, or gdk-window-invalidate-rect directly, to schedule a redraw of a <gtk-drawing-area> or some portion thereof.

Frequently you can just call gdk-window-invalidate-rect or gdk-window-invalidate-region instead of this function. Those functions will invalidate only a single window, instead of the widget and all its children.

The advantage of adding to the invalidated region compared to simply drawing immediately is efficiency; using an invalid region ensures that you only have to redraw one time.

widget  a <gtk-widget>
x  x coordinate of upper-left corner of rectangle to redraw
y  y coordinate of upper-left corner of rectangle to redraw
width  width of region to draw
height  height of region to draw

GtkWidget-reset-shapes (self <gtk-widget>)
reset-shapes
Recursively resets the shape on this widget and its descendants.

widget  a <gtk-widget>.

GtkWidget-set-app-paintable (self <gtk-widget>)
set-app-paintable
Sets whether the application intends to draw on the widget in an ::expose-event handler.

This is a hint to the widget and does not affect the behavior of the GTK+ core; many widgets ignore this flag entirely. For widgets that do pay attention to the flag, such as <gtk-event-box> and <gtk-window>, the effect is to suppress default themed drawing of the widget’s background. (Children of the widget will still be drawn.) The application is then entirely responsible for drawing the widget background.

Note that the background is still drawn when the widget is mapped. If this is not suitable (e.g. because you want to make a transparent window using an RGBA visual), you can work around this by doing:

gtk_widget_realize (window);
gdk_window_set_back_pixmap (window->window, NULL, FALSE);
gtk_widget_show (window);
Widgets are double buffered by default; you can use this function to turn off the buffering. "Double buffered" simply means that `gdk-window-begin-paint-region` and `gdk-window-end-paint` are called automatically around expose events sent to the widget. `gdk-window-begin-paint` diverts all drawing to a widget’s window to an offscreen buffer, and `gdk-window-end-paint` draws the buffer to the screen. The result is that users see the window update in one smooth step, and don’t see individual graphics primitives being rendered.

In very simple terms, double buffered widgets don’t flicker, so you would only use this function to turn off double buffering if you had special needs and really knew what you were doing.

Note: if you turn off double-buffering, you have to handle expose events, since even the clearing to the background color or pixmap will not happen automatically (as it is done in `gdk-window-begin-paint`).

```
gtk-widget-set-double-buffered (self <gtk-widget>)
  (double_buffered bool)
```

```
set-double-buffered
```

Sets whether the entire widget is queued for drawing when its size allocation changes. By default, this setting is ‘#t’ and the entire widget is redrawn on every size change. If your widget leaves the upper left unchanged when made bigger, turning this setting on will improve performance.

Note that for ‘NO_WINDOW’ widgets setting this flag to ‘#f’ turns off all allocation on resizing: the widget will not even redraw if its position changes; this is to allow containers that don’t draw anything to avoid excess invalidations. If you set this flag on a ‘NO_WINDOW’ widget that does draw on `widget->window`, you are responsible for invalidating both the old and new allocation of the widget when the widget is moved and responsible for invalidating regions newly when the widget increases size.

```
gtk-widget-set-redraw-on-allocate (self <gtk-widget>)
  (redraw_on_allocate bool)
```

```
set-redraw-on-allocate
```

if ‘#t’, the entire widget will be redrawn when it is allocated to a new size. Otherwise, only the new portion of the widget will be redrawn.
gtk-widget-set-composite-name (self <gtk-widget>)
(name mchars)

set-composite-name

Sets a widget’s composite name. The widget must be a composite child of its parent; see gtk-widget-push-composite-child.

widget a <gtk-widget>.
name the name to set.

gtk-widget-set-scroll-adjustments (self <gtk-widget>)
(hadjustment <gtk-adjustment>) (vadjustment <gtk-adjustment>)
⇒ (ret bool)

set-scroll-adjustments

For widgets that support scrolling, sets the scroll adjustments and returns ‘#t’. For widgets that don’t support scrolling, does nothing and returns ‘#f’. Widgets that don’t support scrolling can be scrolled by placing them in a <gtk-viewport>, which does support scrolling.

widget a <gtk-widget>
hadjustment
an adjustment for horizontal scrolling, or ‘#f’
vadjustment
an adjustment for vertical scrolling, or ‘#f’
ret ‘#t’ if the widget supports scrolling

gtk-widget-mnemonic-activate (self <gtk-widget>)
(group_cycling bool) ⇒ (ret bool)

mnemonic-activate

widget

ret

gtk-widget-region-intersect (self <gtk-widget>)
(region <gdk-region>) ⇒ (ret <gdk-region>)

region-intersect

Computes the intersection of a widget’s area and region, returning the intersection. The result may be empty, use gdk-region-empty to check.

widget a <gtk-widget>

region a <gdk-region>, in the same coordinate system as widget->allocation. That is, relative to widget->window for ‘NO_WINDOW’ widgets; relative to the parent window of widget->window for widgets with their own window.

ret A newly allocated region holding the intersection of widget and region. The coordinates of the return value are relative to widget->window for ‘NO_WINDOW’ widgets, and relative to the parent window of widget->window for widgets with their own window.
**gtk-widget-send-expose** (*self <gtk-widget>* (*event <gdk-event>*))  
⇒ (*ret int*)

*send-expose***  
Very rarely-used function. This function is used to emit an expose event signals on a widget. This function is not normally used directly. The only time it is used is when propagating an expose event to a child ‘NO_WINDOW’ widget, and that is normally done using `gtk-container-propagate-expose`. If you want to force an area of a window to be redrawn, use `gdk-window-invalidate-rect` or `gdk-window-invalidate-region`. To cause the redraw to be done immediately, follow that call with a call to `gdk-window-process-updates`.

```plaintext
widget a <gtk-widget>  
event a expose <gdk-event>  
ret return from the event signal emission (’#t’ if the event was handled)
```

**gtk-widget-style-get-property** (*self <gtk-widget>*)(*property-name mchars*) (*value <gvalue>*))

*style-get-property***  
Gets the value of a style property of *widget*.

```plaintext
widget a <gtk-widget>  
property-name the name of a style property  
value location to return the property value
```

**gtk-widget-get-accessible** (*self <gtk-widget>*))

*get-accessible***  
Returns the accessible object that describes the widget to an assistive technology. If no accessibility library is loaded (i.e. no ATK implementation library is loaded via GTK_MODULES or via another application library, such as libgnome), then this `<atk-object>` instance may be a no-op. Likewise, if no class-specific `<atk-object>` implementation is available for the widget instance in question, it will inherit an `<atk-object>` implementation from the first ancestor class for which such an implementation is defined.

The documentation of the **ATK** library contains more information about accessible objects and their uses.

```plaintext
widget a <gtk-widget>  
ret the <atk-object> associated with widget
```

**gtk-widget-child-focus** (*self <gtk-widget>*)(*direction <gtk-direction-type>*)) ⇒ (*ret bool*)

*child-focus***  
This function is used by custom widget implementations; if you’re writing an app, you’d use `gtk-widget-grab-focus` to move the focus to a particular widget, and
gtk-container-set-focus-chain to change the focus tab order. So you may want to investigate those functions instead.

gtk-widget-child-focus is called by containers as the user moves around the window using keyboard shortcuts. direction indicates what kind of motion is taking place (up, down, left, right, tab forward, tab backward). gtk-widget-child-focus invokes the "focus" signal on <gtk-widget>; widgets override the default handler for this signal in order to implement appropriate focus behavior.

The "focus" default handler for a widget should return ‘#t’ if moving in direction left the focus on a focusable location inside that widget, and ‘#f’ if moving in direction moved the focus outside the widget. If returning ‘#t’, widgets normally call gtk-widget-grab-focus to place the focus accordingly; if returning ‘#f’, they don’t modify the current focus location.

This function replaces gtk-container-focus from GTK+ 1.2. It was necessary to check that the child was visible, sensitive, and focusable before calling gtk-container-focus. gtk-widget-child-focus returns ‘#f’ if the widget is not currently in a focusable state, so there’s no need for those checks.

widget a <gtk-widget>
direction direction of focus movement
ret ‘#t’ if focus ended up inside widget

gtk-widget-child-notify (self <gtk-widget>) (child_property mchars) [Function]
child-notify [Method]
Emits a "child-notify" signal for the child property child-property on widget.
This is the analogue of g-object-notify for child properties.

widget a <gtk-widget>
child-property

the name of a child property installed on the class of widget’s parent.

gtk-widget-freeze-child-notify (self <gtk-widget>) [Function]
freeze-child-notify [Method]
Stops emission of "child-notify" signals on widget. The signals are queued until gtk-widget-thaw-child-notify is called on widget.
This is the analogue of g-object-freeze-notify for child properties.

widget a <gtk-widget>

gtk-widget-get-child-visible (self <gtk-widget>) ⇒ (ret bool) [Function]
get-child-visible [Method]
Gets the value set with gtk-widget-set-child-visible. If you feel a need to use this function, your code probably needs reorganization.
This function is only useful for container implementations and never should be called by an application.

widget a <gtk-widget>
ret ‘#t’ if the widget is mapped with the parent.
gtk-widget-get-parent (self <gtk-widget>) ⇒ (ret <gtk-widget>)  
get-parent  
Returns the parent container of widget.

  widget a <gtk-widget>
  ret the parent container of widget, or '#f'

gtk-widget-get-settings (self <gtk-widget>)  
⇒ (ret <gtk-settings>)  
get-settings  
Gets the settings object holding the settings (global property settings, RC file information, etc) used for this widget.

Note that this function can only be called when the <gtk-widget> is attached to a toplevel, since the settings object is specific to a particular <gdk-screen>.

  widget a <gtk-widget>
  ret the relevant <gtk-settings> object

gtk-widget-get-clipboard (self <gtk-widget>)  
(selection <gdk-atom>) ⇒ (ret <gtk-clipboard>)  
get-clipboard  
Returns the clipboard object for the given selection to be used with widget. widget must have a <gdk-display> associated with it, so must be attached to a toplevel window.

  widget a <gtk-widget>
  selection a <gdk-atom> which identifies the clipboard to use. ‘GDK_SELECTION_CLIPBOARD’ gives the default clipboard. Another common value is ‘GDK_SELECTION_PRIMARY’, which gives the primary X selection.
  ret the appropriate clipboard object. If no clipboard already exists, a new one will be created. Once a clipboard object has been created, it is persistent for all time.

Since 2.2

gtk-widget-get-display (self <gtk-widget>)  
⇒ (ret <gdk-display>)  
get-display  
Get the <gdk-display> for the toplevel window associated with this widget. This function can only be called after the widget has been added to a widget hierarchy with a <gtk-window> at the top.

In general, you should only create display specific resources when a widget has been realized, and you should free those resources when the widget is unrealized.

  widget a <gtk-widget>
  ret the <gdk-display> for the toplevel for this widget.

Since 2.2
**gtk-widget-get-root-window** *(self <gtk-widget>)*

**[Function]**

⇒ *(ret <gdk-window>)*

**get-root-window**

Get the root window where this widget is located. This function can only be called after the widget has been added to a widget hierarchy with `<gtk-window>` at the top.

The root window is useful for such purposes as creating a popup `<gdk-window>` associated with the window. In general, you should only create display specific resources when a widget has been realized, and you should free those resources when the widget is unrealized.

`widget`  a `<gtk-widget>`

`ret`  the `<gdk-window>` root window for the toplevel for this widget.

Since 2.2

**gtk-widget-get-screen** *(self <gtk-widget>)* ⇒ *(ret <gdk-screen>)*

**[Function]**

**get-screen**

Get the `<gdk-screen>` from the toplevel window associated with this widget. This function can only be called after the widget has been added to a widget hierarchy with a `<gtk-window>` at the top.

In general, you should only create screen specific resources when a widget has been realized, and you should free those resources when the widget is unrealized.

`widget`  a `<gtk-widget>`

`ret`  the `<gdk-screen>` for the toplevel for this widget.

Since 2.2

**gtk-widget-has-screen** *(self <gtk-widget>)* ⇒ *(ret bool)*

**[Function]**

**has-screen**

Checks whether there is a `<gdk-screen>` is associated with this widget. All toplevel widgets have an associated screen, and all widgets added into a heirarchy with a toplevel window at the top.

`widget`  a `<gtk-widget>`

`ret`  ‘#t’ if there is a `<gdk-screen>` associated with the widget.

Since 2.2

**gtk-widget-get-size-request** *(self <gtk-widget>)* ⇒ *(width int) (height int)*

**[Function]**

**get-size-request**

Gets the size request that was explicitly set for the widget using **gtk-widget-set-size-request**. A value of -1 stored in `width` or `height` indicates that that dimension has not been set explicitly and the natural requisition of the widget will be used instead. See **gtk-widget-set-size-request**. To get the size a widget will actually use, call **gtk-widget-size-request** instead of this function.

`widget`  a `<gtk-widget>`

`width`  return location for width, or ‘#f’

`height`  return location for height, or ‘#f’
Chapter 138: GtkWidget

**gtk-widget-set-child-visible** (self <gtk-widget>) (is_visible bool)  [Function]

**set-child-visible**  [Method]

Sets whether *widget* should be mapped along with its when its parent is mapped and *widget* has been shown with `gtk-widget-show`.

The child visibility can be set for *widget* before it is added to a container with `gtk-widget-set-parent`, to avoid mapping children unnecessarily before immediately unmapping them. However it will be reset to its default state of `'#t'` when the widget is removed from a container.

Note that changing the child visibility of a widget does not queue a resize on the widget. Most of the time, the size of a widget is computed from all visible children, whether or not they are mapped. If this is not the case, the container can queue a resize itself.

This function is only useful for container implementations and never should be called by an application.

```plaintext
widget    a <gtk-widget>
is-visible if `'#t'`, *widget* should be mapped along with its parent.
```

**gtk-widget-set-size-request** (self <gtk-widget>) (width int) (height int)  [Function]

**set-size-request**  [Method]

Sets the minimum size of a widget; that is, the widget’s size request will be `width` by `height`. You can use this function to force a widget to be either larger or smaller than it normally would be.

In most cases, `gtk-window-set-default-size` is a better choice for toplevel windows than this function; setting the default size will still allow users to shrink the window. Setting the size request will force them to leave the window at least as large as the size request. When dealing with window sizes, `gtk-window-set-geometry-hints` can be a useful function as well.

Note the inherent danger of setting any fixed size - themes, translations into other languages, different fonts, and user action can all change the appropriate size for a given widget. So, it’s basically impossible to hardcode a size that will always be correct.

The size request of a widget is the smallest size a widget can accept while still functioning well and drawing itself correctly. However in some strange cases a widget may be allocated less than its requested size, and in many cases a widget may be allocated more space than it requested.

If the size request in a given direction is -1 (unset), then the "natural" size request of the widget will be used instead.

Widgets can’t actually be allocated a size less than 1 by 1, but you can pass 0,0 to this function to mean "as small as possible."

```plaintext
widget    a <gtk-widget>
width     width *widget* should request, or -1 to unset
height    height *widget* should request, or -1 to unset
```
**gtk-widget-thaw-child-notify (self <gtk-widget>)**  
*Function*

*Method*

Reverts the effect of a previous call to `gtk-widget-freeze-child-notify`. This causes all queued "child-notify" signals on `widget` to be emitted.

```markdown
widget
```

**gtk-widget-set-no-show-all (self <gtk-widget>)**

*Function*

*Method*

Sets the "no_show_all" property, which determines whether calls to `gtk-widget-show-all` and `gtk-widget-hide-all` will affect this widget.

This is mostly for use in constructing widget hierarchies with externally controlled visibility, see `<gtk-ui-manager>`.

```markdown
widget
no-show-all
```

Since 2.4

**gtk-widget-get-no-show-all (self <gtk-widget>) ⇒ (ret bool)**

*Function*

*Method*

Returns the current value of the "no_show_all" property, which determines whether calls to `gtk-widget-show-all` and `gtk-widget-hide-all` will affect this widget.

```markdown
widget
ret
```

Since 2.4

**gtk-widget-list-mnemonic-labels (self <gtk-widget>)**

*Function*

*Method*

Returns a newly allocated list of the widgets, normally labels, for which this widget is a the target of a mnemonic (see for example, `gtk-label-set-mnemonic-widget`). The widgets in the list are not individually referenced. If you want to iterate through the list and perform actions involving callbacks that might destroy the widgets, you must call `g_list_foreach (result, (GFunc)g_object_ref, NULL)` first, and then unref all the widgets afterwards.

```markdown
widget
ret
```

Since 2.4

**gtk-widget-add-mnemonic-label (self <gtk-widget>)**

*Function*

*Method*

Adds a widget to the list of mnemonic labels for this widget. (See `gtk-widget-list-mnemonic-labels`). Note the list of mnemonic labels for the widget is cleared when
the widget is destroyed, so the caller must make sure to update its internal state at
this point as well, by using a connection to the ::destroy signal or a weak notifier.

```
widget  a <gtk-widget>
label   a <gtk-widget> that acts as a mnemonic label for widget.
```

Since 2.4

```
gtk-widget-remove-mnemonic-label (self <gtk-widget>) (label <gtk-widget>)
```

```remove-mnemonic-label```

Removes a widget from the list of mnemonic labels for this widget. (See `gtk-widget-
list-mnemonic-labels`). The widget must have previously been added to the list
with `gtk-widget-add-mnemonic-label`.

```
widget  a <gtk-widget>
label   a <gtk-widget> that was previously set as a mnemonic label for widget
         with `gtk-widget-add-mnemonic-label`.
```

Since 2.4

```
gtk-widget-get-action (self <gtk-widget>) ⇒ (ret <gtk-action>)
get-action
```

Returns the `<gtk-action>` that `widget` is a proxy for. See also `gtk-action-get-
proxies`.

```
widget  a <gtk-widget>
ret     the action that a widget is a proxy for, or ‘#f’, if it is not attached to an
        action.
```

Since 2.10

```
gtk-widget-is-composited (self <gtk-widget>) ⇒ (ret bool)
is-composited
```

Whether `widget` can rely on having its alpha channel drawn correctly. On X11 this
function returns whether a compositing manager is running for `widget`’s screen

```
widget  a <gtk-widget>
ret     ‘#t’ if the widget can rely on its alpha channel being drawn correctly.
```

Since 2.10

```
gtk-requisition-copy (self <gtk-requisition>) ⇒ (ret <gtk-requisition>)
```

Copies a `<gtk-requisition>`.

```requisition  a <gtk-requisition>.
ret           a copy of `requisition`.```
139 GtkIMContext

Base class for input method contexts

139.1 Overview

139.2 Usage

```javascript
<gtk-im-context> [Class]
    Derives from <gobject>.
    This class defines no direct slots.

preedit-start [Signal on <gtk-im-context>]
preedit-end [Signal on <gtk-im-context>]
preedit-changed [Signal on <gtk-im-context>]
commit (arg0 <gchararray>) [Signal on <gtk-im-context>]
retrieved-surrounding ⇒ <gboolean> [Signal on <gtk-im-context>]
delete-surrounding (arg0 <gint>) (arg1 <gint>) ⇒ <gboolean> [Signal on <gtk-im-context>]

gtk-im-context-set-client-window (self <gtk-im-context>) [Function]
    set-client-window [Method]
    Set the client window for the input context; this is the <gdk-window> in which the
    input appears. This window is used in order to correctly position status windows,
    and may also be used for purposes internal to the input method.

context a <gtk-im-context>
window the client window. This may be ‘#f’ to indicate that the previous client
window no longer exists.

gtk-im-context-filter-keypress (self <gtk-im-context>) [Function]
    filter-keypress [Method]
    Allow an input method to internally handle key press and release events. If this
    function returns ‘#t’, then no further processing should be done for this key event.

context a <gtk-im-context>
event the key event
ret ‘#t’ if the input method handled the key event.

gtk-im-context-focus-in (self <gtk-im-context>) [Function]
    focus-in [Method]
    Notify the input method that the widget to which this input context corresponds has
    gained focus. The input method may, for example, change the displayed feedback to
    reflect this change.

context a <gtk-im-context>
```
**Chapter 139: GtkIMContext**

**gtk-im-context-focus-out**

```c
(gtk-im-context) focus-out
```

Notify the input method that the widget to which this input context corresponds has lost focus. The input method may, for example, change the displayed feedback or reset the contexts state to reflect this change.

```c
context a (gtk-im-context)
```

**gtk-im-context-reset**

```c
(gtk-im-context) reset
```

Notify the input method that a change such as a change in cursor position has been made. This will typically cause the input method to clear the preedit state.

```c
context a (gtk-im-context)
```

**gtk-im-context-set-cursor-location**

```c
(gdk-rectangle) set-cursor-location
```

Notify the input method that a change in cursor position has been made. The location is relative to the client window.

```c
context a (gtk-im-context)
area new location
```

**gtk-im-context-set-use-preedit**

```c
bool set-use-preedit
```

Sets whether the IM context should use the preedit string to display feedback. If `use-preedit` is FALSE (default is TRUE), then the IM context may use some other method to display feedback, such as displaying it in a child of the root window.

```c
context a (gtk-im-context)
use-preedit whether the IM context should use the preedit string.
```

**gtk-im-context-set-surrounding**

```c
UTF-8 text mchars (len int) (cursor_index int)
```

Sets surrounding context around the insertion point and preedit string. This function is expected to be called in response to the GtkIMContext::retrieve_surrounding signal, and will likely have no effect if called at other times.

```c
context a (gtk-im-context)
text text surrounding the insertion point, as UTF-8. the preedit string should not be included within text.
len the length of text, or -1 if text is nul-terminated
cursor-index the byte index of the insertion cursor within text.
Chapter 139: GtkIMContext

Function
gtk-im-context-get-surrounding (self <gtk-im-context>) ⇒ (ret bool) (text mchars) (cursor_index int)

get-surrounding
Retrieves context around the insertion point. Input methods typically want context in order to constrain input text based on existing text; this is important for languages such as Thai where only some sequences of characters are allowed.

This function is implemented by emitting the GtkIMContext::retrieve_surrounding signal on the input method; in response to this signal, a widget should provide as much context as is available, up to an entire paragraph, by calling gtk-im-context-set-surrounding. Note that there is no obligation for a widget to respond to the ::retrieve_surrounding signal, so input methods must be prepared to function without context.

context a <gtk-im-context>

text location to store a UTF-8 encoded string of text holding context around the insertion point. If the function returns ‘#t’, then you must free the result stored in this location with g-free.

cursor-index
location to store byte index of the insertion cursor within text.

ret ‘#t’ if surrounding text was provided; in this case you must free the result stored in *text.

Function
gtk-im-context-delete-surrounding (self <gtk-im-context>) ⇒ (ret bool)

delete-surrounding
Asks the widget that the input context is attached to to delete characters around the cursor position by emitting the GtkIMContext::delete_surrounding signal. Note that offset and n-chars are in characters not in bytes which differs from the usage other places in <gtk-im-context>.

In order to use this function, you should first call gtk-im-context-get-surrounding to get the current context, and call this function immediately afterwards to make sure that you know what you are deleting. You should also account for the fact that even if the signal was handled, the input context might not have deleted all the characters that were requested to be deleted.

This function is used by an input method that wants to make substitutions in the existing text in response to new input. It is not useful for applications.

context a <gtk-im-context>

offset offset from cursor position in chars; a negative value means start before the cursor.

n-chars number of characters to delete.

ret ‘#t’ if the signal was handled.
Chapter 140: GtkPlug

140 GtkPlug

Toplevel for embedding into other processes

140.1 Overview

Together with <gtk-socket>, <gtk-plug> provides the ability to embed widgets from one process into another process in a fashion that is transparent to the user. One process creates a <gtk-socket> widget and, passes the ID of that window to the other process, which then creates a <gtk-plug> with that window ID. Any widgets contained in the <gtk-plug> then will appear inside the first application's window.

The <gtk-plug> and <gtk-socket> widgets are currently not available on all platforms supported by GTK+.

140.2 Usage

<gtk-plug> [Class]

Derives from <gtk-window>.

This class defines the following slots:

 embedded Whether or not the plug is embedded

 embedded [Signal on <gtk-plug>]

 gtk-plug-construct (self <gtk-plug>) (socket_id unsigned-long) [Function]

 construct [Method]

 Finish the initialization of plug for a given <gtk-socket> identified by socket-id. This function will generally only be used by classes deriving from <gtk-plug>.

 plug a <gtk-plug>.

 socket-id the XID of the socket’s window.

 gtk-plug-construct-for-display (self <gtk-plug>)
 (display <gdk-display>) (socket_id unsigned-long) [Function]

 construct-for-display [Method]

 Finish the initialization of plug for a given <gtk-socket> identified by socket-id which is currently displayed on display. This function will generally only be used by classes deriving from <gtk-plug>.

 plug a <gtk-plug>.

 display the <gdk-display> associated with socket-id’s <gtk-socket>.

 socket-id the XID of the socket’s window.

Since 2.2

 gtk-plug-new (socket_id unsigned-long) ⇒ (ret <gtk-widget>) [Function]

 Creates a new plug widget inside the <gtk-socket> identified by socket-id. If socket-id is 0, the plug is left "unplugged" and can later be plugged into a <gtk-socket> by gtk-socket-add-id.
socket-id  the window ID of the socket, or 0.
ret      the new <gtk-plug> widget.

**gtk-plug-new-for-display** (display <gdk-display>) [Function]
   (socket_id unsigned-long) ⇒ (ret <gtk-widget>)
Create a new plug widget inside the <gtk-socket> identified by socket_id.

  display  the <gdk-display> on which socket-id is displayed
  socket-id the XID of the socket’s window.
  ret      the new <gtk-plug> widget.

Since 2.2

**gtk-plug-get-id** (self <gtk-plug>) ⇒ (ret unsigned-long) [Function]
get-id [Method]

  Gets the window ID of a <gtk-plug> widget, which can then be used to embed this
  window inside another window, for instance with gtk-socket-add-id.

  plug      a <gtk-plug>.
  ret       the window ID for the plug
Chapter 141: GtkSocket

141 GtkSocket

Container for widgets from other processes

141.1 Overview

Together with `<gtk-plug>`, `<gtk-socket>` provides the ability to embed widgets from one process into another process in a fashion that is transparent to the user. One process creates a `<gtk-socket>` widget and, passes the that widget’s window ID to the other process, which then creates a `<gtk-plug>` with that window ID. Any widgets contained in the `<gtk-plug>` then will appear inside the first applications window.

The socket’s window ID is obtained by using `gtk-socket-get-id`. Before using this function, the socket must have been realized, and for hence, have been added to its parent.

```c
GtkWidget *socket = gtk_socket_new ();
gtk_widget_show (socket);
gtk_container_add (GTK_CONTAINER (parent), socket);

/* The following call is only necessary if one of 
 * the ancestors of the socket is not yet visible. 
*/
gtk_widget_realize (socket);
g_print ("The ID of the sockets window is %x\n",
    gtk_socket_get_id (socket));
```

Note that if you pass the window ID of the socket to another process that will create a plug in the socket, you must make sure that the socket widget is not destroyed until that plug is created. Violating this rule will cause unpredictable consequences, the most likely consequence being that the plug will appear as a separate toplevel window. You can check if the plug has been created by examining the field of the `<gtk-socket>` structure. If this field is non-`#f`, then the plug has been successfully created inside of the socket.

When GTK+ is notified that the embedded window has been destroyed, then it will destroy the socket as well. You should always, therefore, be prepared for your sockets to be destroyed at any time when the main event loop is running.

The communication between a `<gtk-socket>` and a `<gtk-plug>` follows the XEmbed protocol. This protocol has also been implemented in other toolkits, e.g., allowing the same level of integration when embedding a widget in GTK or vice versa.

A socket can also be used to swallow arbitrary pre-existing top-level windows using `gtk-socket-steal`, though the integration when this is done will not be as close as between a `<gtk-plug>` and a `<gtk-socket>`.

The `<gtk-plug>` and `<gtk-socket>` widgets are currently not available on all platforms supported by GTK+.

141.2 Usage

`<gtk-socket>`

Derives from `<gtk-container>`.
This class defines no direct slots.

plug-added [Signal on <gtk-socket>]
This signal is emitted when a client is successfully added to the socket.

plug-removed ⇒ <gboolean> [Signal on <gtk-socket>]
This signal is emitted when a client is removed from the socket. The default action is to destroy the <gtk-socket> widget, so if you want to reuse it you must add a signal handler that returns ‘#t’.

gtk-socket-new ⇒ (ret <gtk-widget>) [Function]
Create a new empty <gtk-socket>.

ret the new <gtk-socket>.

gtk-socket-add-id (self <gtk-socket>) (window_id unsigned-long) [Function]
add-id [Method]
Adds an XEMBED client, such as a <gtk-plug>, to the <gtk-socket>. The client may be in the same process or in a different process.

To embed a <gtk-plug> in a <gtk-socket>, you can either create the <gtk-plug> with ‘gtk_plug_new (0)’, call gtk-plug-get-id to get the window ID of the plug, and then pass that to the gtk-socket-add-id, or you can call gtk-socket-get-id to get the window ID for the socket, and call gtk-plug-new passing in that ID.

The <gtk-socket> must have already be added into a toplevel window before you can make this call.

socket a <gtk-socket>

window-id the window ID of a client participating in the XEMBED protocol.

gtk-socket-get-id (self <gtk-socket>) ⇒ (ret unsigned-long) [Function]
get-id [Method]
Gets the window ID of a <gtk-socket> widget, which can then be used to create a client embedded inside the socket, for instance with gtk-plug-new.

The <gtk-socket> must have already be added into a toplevel window before you can make this call.

socket a <gtk-socket>.

ret the window ID for the socket
142 GtkCurve

Allows direct editing of a curve

142.1 Overview

This widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

The `<gtk-curve>` widget allows the user to edit a curve covering a range of values. It is typically used to fine-tune color balances in graphics applications like the Gimp.

The `<gtk-curve>` widget has 3 modes of operation - spline, linear and free. In spline mode the user places points on the curve which are automatically connected together into a smooth curve. In linear mode the user places points on the curve which are connected by straight lines. In free mode the user can draw the points of the curve freely, and they are not connected at all.

142.2 Usage

```
<gtk-curve>                   [Class]
    Derives from `<gtk-drawing-area>`.
    This class defines the following slots:
    curve-type
        Is this curve linear, spline interpolated, or free-form
    min-x    Minimum possible value for X
    max-x    Maximum possible X value
    min-y    Minimum possible value for Y
    max-y    Maximum possible value for Y

curve-type-changed          [Signal on `<gtk-curve>`]
    Emitted when the curve type has been changed. The curve type can be changed
    explicitly with a call to `gtk-curve-set-curve-type`. It is also changed as a side-
    effect of calling `gtk-curve-reset` or `gtk-curve-set-gamma`.

gtk-curve-new ⇒ (ret <gtk-widget>) [Function]
    Creates a new `<gtk-curve>`.
    ret     a new `<gtk-curve>`.

gtk-curve-reset (self <gtk-curve>) [Function]
    reset   [Method]
    Resets the curve to a straight line from the minimum x and y values to the maximum
    x and y values (i.e. from the bottom-left to the top-right corners). The curve type is
    not changed.
    curve       a `<gtk-curve>`.
```
**gtk-curve-set-gamma** *(self <gtk-curve>)(gamma float)*  
*set-gamma*  
Recomputes the entire curve using the given gamma value. A gamma value of 1 results in a straight line. Values greater than 1 result in a curve above the straight line. Values less than 1 result in a curve below the straight line. The curve type is changed to ‘GTK_CURVE_TYPE_FREE’. FIXME: Needs a more precise definition of gamma.

- *curve* a <gtk-curve>.
- *gamma* the gamma value.

**gtk-curve-set-range** *(self <gtk-curve>)(min_x float)(max_x float)(min_y float)(max_y float)*  
*set-range*  
Sets the minimum and maximum x and y values of the curve. The curve is also reset with a call to gtk-curve-reset.

- *curve* a <gtk-curve>.
- *min-x* the minimum x value.
- *max-x* the maximum x value.
- *min-y* the minimum y value.
- *max-y* the maximum y value.
143 GtkGammaCurve

a subclass of for editing gamma curves.

143.1 Overview

This widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

The <gtk-gamma-curve> widget is a variant of <gtk-curve> specifically for editing gamma curves, which are used in graphics applications such as the Gimp.

The <gtk-gamma-curve> widget shows a curve which the user can edit with the mouse just like a <gtk-curve> widget. On the right of the curve it also displays 5 buttons, 3 of which change between the 3 curve modes (spline, linear and free), and the other 2 set the curve to a particular gamma value, or reset it to a straight line.

143.2 Usage

<gtk-gamma-curve> [Class]

Derives from <gtk-vbox>.

This class defines no direct slots.

gtk-gamma-curve-new ⇒ (ret <gtk-widget>) [Function]

Creates a new <gtk-gamma-curve>.

ret a new <gtk-gamma-curve>.
Chapter 144: GtkRuler

144 GtkRuler

Base class for horizontal or vertical rulers

144.1 Overview

This widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

The GTKRuler widget is a base class for horizontal and vertical rulers. Rulers are used to show the mouse pointer’s location in a window. The ruler can either be horizontal or vertical on the window. Within the ruler a small triangle indicates the location of the mouse relative to the horizontal or vertical ruler. See `<gtk-hruler>` to learn how to create a new horizontal ruler. See `<gtk-vruler>` to learn how to create a new vertical ruler.

144.2 Usage

```latex
<gtk-ruler>  
  [Class]  
  Derives from `<gtk-widget>`.  
  This class defines the following slots:  
  lower     Lower limit of ruler  
  upper     Upper limit of ruler  
  position  Position of mark on the ruler  
  max-size  Maximum size of the ruler  
  metric    The metric used for the ruler  

gtk-ruler-set-metric (self <gtk-ruler>) (metric <gtk-metric-type>)  
  [Function]  
  set-metric  
  This calls the `<gtk-metric-type>` to set the ruler to units defined. Available units are GTK_PIXELS, GTK_INCHES, or GTK_CENTIMETERS. The default unit of measurement is GTK_PIXELS.  
  ruler     the gtkruler  
  metric    the unit of measurement  

gtk-ruler-set-range (self <gtk-ruler>) (lower double) (upper double) (position double) (max-size double)  
  [Function]  
  set-range  
  This sets the range of the ruler using gfloat lower, gfloat upper, gfloat position, and gfloat max_size.  
  ruler     the gtkruler  
  lower     the lower limit of the ruler
```
Chapter 144: GtkRuler

upper the upper limit of the ruler

position the mark on the ruler

max-size the maximum size of the ruler

```markdown

**gtk-ruler-get-metric** (self <gtk-ruler>) ⇒ (ret <gtk-metric-type>)

get-metric [Function]

Gets the units used for a `<gtk-ruler>`. See `gtk-ruler-set-metric`.

ruler a `<gtk-ruler>`

ret the units currently used for `ruler`

**gtk-ruler-get-range** (self <gtk-ruler>) ⇒ (lower double) (upper double) (position double) (max-size double)

get-range [Function]

Retrieves values indicating the range and current position of a `<gtk-ruler>`. See `gtk-ruler-set-range`.

ruler a `<gtk-ruler>`

lower location to store lower limit of the ruler, or ‘#f’

upper location to store upper limit of the ruler, or ‘#f’

position location to store the current position of the mark on the ruler, or ‘#f’

max-size location to store the maximum size of the ruler used when calculating the space to leave for the text, or ‘#f’.
```
145 GtkHRuler

A horizontal ruler.

145.1 Overview

This widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

The HRuler widget is a widget arranged horizontally creating a ruler that is utilized around other widgets such as a text widget. The ruler is used to show the location of the mouse on the window and to show the size of the window in specified units. The available units of measurement are GTK_PIXELS, GTK_INCHES and GTK_CENTIMETERS. GTK_PIXELS is the default. rulers.

145.2 Usage

<gtk-hruler>  [Class]
     Derives from <gtk-ruler>.
     This class defines no direct slots.

<gtk-hruler-new>  [Function]
     Creates a new horizontal ruler.

     ret a new <gtk-hruler>.  
146 GtkVRuler

A vertical ruler.

146.1 Overview

This widget is considered too specialized/little-used for GTK+, and will in the future be moved to some other package. If your application needs this widget, feel free to use it, as the widget does work and is useful in some applications; it’s just not of general interest. However, we are not accepting new features for the widget, and it will eventually move out of the GTK+ distribution.

The VRuler widget is a widget arranged vertically creating a ruler that is utilized around other widgets such as a text widget. The ruler is used to show the location of the mouse on the window and to show the size of the window in specified units. The available units of measurement are GTK_PIXELS, GTK_INCHES and GTK_CENTIMETERS. GTK_PIXELS is the default.

146.2 Usage

&lt;gtk-vruler&gt;  
Derives from &lt;gtk-ruler&gt;.
This class defines no direct slots.

gtk-vruler-new ⇒ (ret &lt;gtk-widget&gt;)
Creates a new vertical ruler
ret a new &lt;gtk-vruler&gt;.
147 GtkRecentManager

Managing Recently Used Files

147.1 Overview

*<gtk-recent-manager>* provides a facility for adding, removing and looking up recently used files. Each recently used file is identified by its URI, and has meta-data associated to it, like the names and command lines of the applications that have registered it, the number of time each application has registered the same file, the mime type of the file and whether the file should be displayed only by the applications that have registered it.

The *<gtk-recent-manager>* acts like a database of all the recently used files. You can create new *<gtk-recent-manager>* objects, but it is more efficient to use the standard recent manager for the *<gdk-screen>* so that informations about the recently used files is shared with other people using them. In case the default screen is being used, adding a new recently used file is as simple as:

```c
GtkRecentManager *manager;

manager = gtk_recent_manager_get_default ();
gtk_recent_manager_add_item (manager, file_uri);
```

Recently used files are supported since GTK+ 2.10.

147.2 Usage

*<gtk-recent-manager>*

Derives from *<gobject>*.

This class defines the following slots:
filename  The full path to the file to be used to store and read the list
limit   The maximum number of items to be returned by gtk_recent_manager_get_items()
size    The size of the recently used resources list

changed  [Signal on <gtk-recent-manager>]
Emitted when the current recently used resources manager changes its contents.
Since 2.10

<gtk-recent-info>  [Class]
Derives from <gboxed>.
This class defines no direct slots.

gtk_recent_manager_new ⇒ (ret <gtk-recent-manager>)  [Function]
Creates a new recent manager object. Recent manager objects are used to handle the
list of recently used resources. A <gtk-recent-manager> object monitors the recently
used resources list, and emits the "changed" signal each time something inside the
list changes.
<gtk-recent-manager> objects are expensive: be sure to create them only when
needed. You should use the gtk_recent_manager_new_for_screen or the gtk-
recent-manager-get-default functions instead.
ret    A newly created <gtk-recent-manager> object.
Since 2.10

gtk_recent_manager_get_default ⇒ (ret <gtk-recent-manager>)  [Function]
Gets the recent manager for the default screen. See gtk_recent_manager_get-for-
screen.
ret    A unique <gtk-recent-manager> associated with the default screen.
This recent manager is associated with the screen and can be used as
long as the screen is open. Do not ref or unref it.
Since 2.10

gtk_recent_manager_get_for_screen (screen <gdk-screen>)  [Function]
default
⇒ (ret <gtk-recent-manager>)
Gets the recent manager object associated with screen; if this function has not previ-
ously been called for the given screen, a new recent manager object will be created and
associated with the screen. Recent manager objects are fairly expensive to create, so
using this function is usually a better choice than calling gtk_recent_manager_new
and setting the screen yourself; by using this function a single recent manager object
will be shared between users.
screen    a <gdk-screen>
ret    A unique <gtk-recent-manager> associated with the given screen. This
recent manager is associated to the with the screen and can be used as
long as the screen is open. Do not ref or unref it.
Since 2.10
gtk-recent-manager-set-screen (self <gtk-recent-manager>)  [Function]
  (screen <gdk-screen>)

set-screen  [Method]
  Sets the screen for a recent manager; the screen is used to track the user’s currently
configured recently used documents storage.

  manager  a <gtk-recent-manager>
  screen  a <gdk-screen>

Since 2.10

gtk-recent-manager-add-item (self <gtk-recent-manager>)  [Function]
  (uri mchars) ⇒ (ret bool)

add-item  [Method]
  Adds a new resource, pointed by uri, into the recently used resources list.

  This function automatically retrieving some of the needed metadata and setting other
metadata to common default values; it then feeds the data to gtk-recent-manager-
add-full.

  See gtk-recent-manager-add-full if you want to explicitely define the metadata
for the resource pointed by uri.

  manager  a <gtk-recent-manager>
  uri  a valid URI
  ret  ‘#t’ if the new item was successfully added to the recently used resources
  list

Since 2.10

gtk-recent-manager-remove-item (self <gtk-recent-manager>)  [Function]
  (uri mchars) ⇒ (ret bool)

remove-item  [Method]
  Removes a resource pointed by uri from the recently used resources list handled by a
recent manager.

  manager  a <gtk-recent-manager>
  uri  the URI of the item you wish to remove
  error  return location for a <g-error>, or ‘#f’
  ret  ‘#t’ if the item pointed by uri has been successfully removed by the
  recently used resources list, and ‘#f’ otherwise.

Since 2.10

gtk-recent-manager-lookup-item (self <gtk-recent-manager>)  [Function]
  (uri mchars) ⇒ (ret <gtk-recent-info>)

lookup-item  [Method]
  Searches for a URI inside the recently used resources list, and returns a structure
containing informations about the resource like its MIME type, or its display name.

  manager  a <gtk-recent-manager>
Chapter 147: GtkRecentManager

uri a URI
error a return location for a <g-error>, or ‘#f’
ret a <gtk-recent-info> structure containing information about the re-
source pointed by uri, or ‘#f’ if the URI was not registered in the recently
used resources list. Free with gtk-recent-info-unref.

Since 2.10

gtk-recent-manager-has-item (self <gtk-recent-manager>) [Function]
  (uri mchars) ⇒ (ret bool)
has-item [Method]
  Checks whether there is a recently used resource registered with uri inside the recent
  manager.
manager a <gtk-recent-manager>
uri a URI
ret ‘#t’ if the resource was found, ‘#f’ otherwise.

Since 2.10

gtk-recent-manager-move-item (self <gtk-recent-manager>) [Function]
  (uri mchars) (new_uri mchars) ⇒ (ret bool)
move-item [Method]
  Changes the location of a recently used resource from uri to new-uri.
  Please note that this function will not affect the resource pointed by the URIs, but
  only the URI used in the recently used resources list.
manager a <gtk-recent-manager>
uri the URI of a recently used resource
new-uri the new URI of the recently used resource, or ‘#f’ to remove the item
  pointed by uri in the list
error a return location for a <g-error>, or ‘#f’
ret ‘#t’ on success.

Since 2.10

gtk-recent-manager-get-limit (self <gtk-recent-manager>) [Function]
  ⇒ (ret int)
get-limit [Method]
  Gets the maximum number of items that the gtk-recent-manager-get-items func-
  tion should return.
manager a <gtk-recent-manager>
ret the number of items to return, or -1 for every item.

Since 2.10
### gtk-recent-manager-set-limit

```c
Function

\textbf{gtk-recent-manager-set-limit} \quad (self <\text{gtk-recent-manager}>)
```

**Method**

Sets the maximum number of item that the \texttt{gtk-recent-manager-get-items} function should return. If \texttt{limit} is set to -1, then return all the items.

- \texttt{manager} a \texttt{<gtk-recent-manager>}
- \texttt{limit} the maximum number of items to return, or -1.

Since 2.10

### gtk-recent-manager-get-items

```c
Function

\textbf{gtk-recent-manager-get-items} \quad (self <\text{gtk-recent-manager}>)
```

**Method**

Gets the list of recently used resources.

- \texttt{manager} a \texttt{<gtk-recent-manager>}
- \texttt{ret} a list of newly allocated \texttt{<gtk-recent-info>} objects. Use \texttt{gtk-recent-info-unref} on each item inside the list, and then free the list itself using \texttt{g-list-free}.

Since 2.10

### gtk-recent-manager-purge-items

```c
Function

\textbf{gtk-recent-manager-purge-items} \quad (self <\text{gtk-recent-manager}>)
```

**Method**

Purges every item from the recently used resources list.

- \texttt{manager} a \texttt{<gtk-recent-manager>}
- \texttt{error} a return location for a \texttt{<g-error>}, or ‘\#f’
- \texttt{ret} the number of items that have been removed from the recently used resources list.

Since 2.10

### gtk-recent-info-get-uri

```c
Function

\textbf{gtk-recent-info-get-uri} \quad (self <\text{gtk-recent-info}>)
```

Gets the URI of the resource.

- \texttt{info} a \texttt{<gtk-recent-info>}
- \texttt{ret} the URI of the resource. The returned string is owned by the recent manager, and should not be freed.

Since 2.10

### gtk-recent-info-get-display-name

```c
Function

\textbf{gtk-recent-info-get-display-name} \quad (self <\text{gtk-recent-info}>)
```

Gets the name of the resource. If none has been defined, the basename of the resource is obtained.

- \texttt{info} a \texttt{<gtk-recent-info>}
The display name of the resource. The returned string is owned by the recent manager, and should not be freed.

Since 2.10

```
gtk-recent-info-get-description (self <gtk-recent-info>) ⇒ (ret mchars)
```

Gets the (short) description of the resource.

```
info a <gtk-recent-info>
ret the description of the resource. The returned string is owned by the recent manager, and should not be freed.
```

Since 2.10

```
gtk-recent-info-get-mime-type (self <gtk-recent-info>) ⇒ (ret mchars)
```

Gets the MIME type of the resource.

```
info a <gtk-recent-info>
ret the MIME type of the resource. The returned string is owned by the recent manager, and should not be freed.
```

Since 2.10

```
gtk-recent-info-get-added (self <gtk-recent-info>) ⇒ (ret long)
```

Gets the timestamp (seconds from system’s Epoch) when the resource was added to the recently used resources list.

```
info a <gtk-recent-info>
ret the number of seconds elapsed from system’s Epoch when the resource was added to the list, or -1 on failure.
```

Since 2.10

```
gtk-recent-info-get-modified (self <gtk-recent-info>) ⇒ (ret long)
```

Gets the timestamp (seconds from system’s Epoch) when the resource was last modified.

```
info a <gtk-recent-info>
ret the number of seconds elapsed from system’s Epoch when the resource was last modified, or -1 on failure.
```

Since 2.10

```
gtk-recent-info-get-visited (self <gtk-recent-info>) ⇒ (ret long)
```

 Gets the timestamp (seconds from system’s Epoch) when the resource was last visited.

```
info a <gtk-recent-info>
```
the number of seconds elapsed from system’s Epoch when the resource was last visited, or -1 on failure.

Since 2.10

`gtk-recent-info-get-private-hint` *(self <gtk-recent-info>) [Function]*

⇒ (ret bool)

Gets the value of the "private" flag. Resources in the recently used list that have this flag set to ‘#t’ should only be displayed by the applications that have registered them.

info  a <gtk-recent-info>

ret ‘#t’ if the private flag was found, ‘#f’ otherwise.

Since 2.10

`gtk-recent-info-last-application` *(self <gtk-recent-info>) [Function]*

⇒ (ret mchars)

Gets the name of the last application that have registered the recently used resource represented by info.

info  a <gtk-recent-info>

ret an application name. Use `g-free` to free it.

Since 2.10

`gtk-recent-info-has-group` *(self <gtk-recent-info>) [Function]*

⇒ (ret bool)

Checks whether group-name appears inside the groups registered for the recently used item info.

info  a <gtk-recent-info>

group-name name of a group

ret ‘#t’ if the group was found.

Since 2.10

`gtk-recent-info-has-application` *(self <gtk-recent-info>) [Function]*

⇒ (ret bool)

Checks whether an application registered this resource using app-name.

info  a <gtk-recent-info>

app-name a string containing an application name

ret ‘#t’ if an application with name app-name was found, ‘#f’ otherwise.

Since 2.10

`gtk-recent-info-get-icon` *(self <gtk-recent-info>) (size int) [Function]*

⇒ (ret <gdk-pixbuf>)

Retrieves the icon of size size associated to the resource MIME type.
Chapter 147: GtkRecentManager

```

info  a <gtk-recent-info>
size  the size of the icon in pixels
ret   a <gdk-pixbuf> containing the icon, or ‘#f’.

Since 2.10

gtk-recent-info-get-short-name (self <gtk-recent-info>) ⇒ (ret mchars)
Computes a valid UTF-8 string that can be used as the name of the item in a menu or list. For example, calling this function on an item that refers to "file:///foo/bar.txt" will yield "bar.txt".

info  an <gtk-recent-info>
ret   A newly-allocated string in UTF-8 encoding; free it with g-free.

Since 2.10

gtk-recent-info-get-uri-display (self <gtk-recent-info>) ⇒ (ret mchars)
Gets a displayable version of the resource’s URI.

info  a <gtk-recent-info>
ret   a UTF-8 string containing the resource’s URI or ‘#f’

Since 2.10

gtk-recent-info-get-age (self <gtk-recent-info>) ⇒ (ret int)
Gets the number of days elapsed since the last update of the resource pointed by info.

info  a <gtk-recent-info>
ret   a positive integer containing the number of days elapsed since the time this resource was last modified.

Since 2.10

gtk-recent-info-is-local (self <gtk-recent-info>) ⇒ (ret bool)
Checks whether the resource is local or not by looking at the scheme of its URI.

info  a <gtk-recent-info>
ret   ‘#t’ if the resource is local.

Since 2.10

gtk-recent-info-exists (self <gtk-recent-info>) ⇒ (ret bool)
Checks whether the resource pointed by info still exists. At the moment this check is done only on resources pointing to local files.

info  a <gtk-recent-info>
ret   ‘#t’ if the resource exists

Since 2.10
```
gtk-recent-info-match (self <gtk-recent-info>) ⇒ (ret bool)
Checks whether two <gtk-recent-info> structures point to the same resource.

info-a  a <gtk-recent-info>
info-b  a <gtk-recent-info>
ret  ‘#t’ if both <gtk-recent-info> structures point to same resource, ‘#f’ otherwise.

Since 2.10
148 GtkRecentChooser

Interface implemented by GtkRecentChooserWidget, GtkRecentChooserMenu and GtkRecentChooserDialog

148.1 Overview

<gtk-recent-chooser> is an interface that can be implemented by widgets displaying the list of recently used files. In GTK+, the main objects that implement this interface are <gtk-recent-chooser-widget>, <gtk-recent-chooser-dialog> and <gtk-recent-chooser-menu>.

Recently used files are supported since GTK+ 2.10.

148.2 Usage

<gtk-recent-chooser> [Class]

Derives from <ginterface>.

This class defines the following slots:

- recent-manager
  The RecentManager object to use
- show-private
  Whether the private items should be displayed
- show-not-found
  Whether the items pointing to unavailable resources should be displayed
- show-tips
  Whether there should be a tooltip on the item
- show-icons
  Whether there should be an icon near the item
- sort-type
  The sorting order of the items displayed
- select-multiple
  Whether to allow multiple items to be selected
- filter
  The current filter for selecting which resources are displayed
- limit
  The maximum number of items to be displayed
- local-only
  Whether the selected resource(s) should be limited to local file: URIs

selection-changed [Signal on <gtk-recent-chooser>]

This signal is emitted when there is a change in the set of selected recently used resources. This can happen when a user modifies the selection with the mouse or the keyboard, or when explicitly calling functions to change the selection.

Since 2.10
**item-activated**  [Signal on `<gtk-recent-chooser>`]
This signal is emitted when the user "activates" a recent item in the recent chooser. This can happen by double-clicking on an item in the recently used resources list, or by pressing
Since 2.10

**gtk-recent-chooser-set-show-private**  [Function]
(self `<gtk-recent-chooser>`) (show_private bool)
set-show-private  [Method]
Whether to show recently used resources marked registered as private.

chooser   a `<gtk-recent-chooser>`
show-private
‘#t’ to show private items, ‘#f’ otherwise
Since 2.10

**gtk-recent-chooser-get-show-private**  [Function]
(self `<gtk-recent-chooser>`) ⇒ (ret bool)
get-show-private  [Method]
Returns whether chooser should display recently used resources registered as private.

chooser   a `<gtk-recent-chooser>`
ret
‘#t’ if the recent chooser should show private items, ‘#f’ otherwise.
Since 2.10

**gtk-recent-chooser-set-show-icons**  [Function]
(show_icons bool)
set-show-icons  [Method]
Sets whether chooser should show an icon near the resource when displaying it.

chooser   a `<gtk-recent-chooser>`
show-icons
whether to show an icon near the resource
Since 2.10

**gtk-recent-chooser-get-show-icons**  [Function]
⇒ (ret bool)
get-show-icons  [Method]
Retrieves whether chooser should show an icon near the resource.

chooser   a `<gtk-recent-chooser>`
ret
‘#t’ if the icons should be displayed, ‘#f’ otherwise.
Since 2.10
gtk-recent-chooser-set-local-only (self <gtk-recent-chooser>) [Function]
  (local_only bool)
set-local-only [Method]
  Sets whether only local resources, that is resources using the file:// URI scheme,
  should be shown in the recently used resources selector. If local-only is ‘#t’ (the de-
  fault) then the shown resources are guaranteed to be accessible through the operating
  system native file system.
  chooser a <gtk-recent-chooser>
  local-only ‘#t’ if only local files can be shown

Since 2.10

gtk-recent-chooser-get-local-only (self <gtk-recent-chooser>) [Function]
  ⇒ (ret bool)
get-local-only [Method]
  Gets whether only local resources should be shown in the recently used resources
  selector. See gtk-recent-chooser-set-local-only
  chooser a <gtk-recent-chooser>
  ret ‘#t’ if only local resources should be shown.

Since 2.10

gtk-recent-chooser-set-limit (self <gtk-recent-chooser>) [Function]
  (limit int)
set-limit [Method]
  Sets the number of items that should be returned by gtk-recent-chooser-get-
  items and gtk-recent-chooser-get-uris.
  chooser a <gtk-recent-chooser>
  limit a positive integer, or -1 for all items

Since 2.10

gtk-recent-chooser-get-limit (self <gtk-recent-chooser>) [Function]
  ⇒ (ret int)
get-limit [Method]
  Gets the number of items returned by gtk-recent-chooser-get-items and gtk-
  recent-chooser-get-uris.
  chooser a <gtk-recent-chooser>
  ret A positive integer, or -1 meaning that all items are returned.

Since 2.10

gtk-recent-chooser-set-show-tips (self <gtk-recent-chooser>) [Function]
  (show_tips bool)
set-show-tips [Method]
  Sets whether to show a tooltips on the widget.
  chooser a <gtk-recent-chooser>
show-tips  ‘#t’ if tooltips should be shown
Since 2.10

\texttt{gtk-recent-chooser-get-show-tips} (\texttt{self <gtk-recent-chooser>})  \texttt{⇒ (ret bool)}
\texttt{get-show-tips}  \texttt{[Method]}
Gets whether \texttt{chooser} should display tooltips.
\begin{itemize}
  \item \texttt{chooser}  a \texttt{<gtk-recent-chooser>}
  \item \texttt{ret}  ‘#t’ if the recent chooser should show tooltips, ‘#f’ otherwise.
\end{itemize}
Since 2.10

\texttt{gtk-recent-chooser-set-show-numbers} \texttt{[Function]}
\begin{itemize}
  \item \texttt{(self <gtk-recent-chooser>)} \texttt{(show_numbers bool)}
\end{itemize}
\texttt{set-show-numbers}  \texttt{[Method]}
Whether to show recently used resources prepended by a unique number.
Do not use this function: use \texttt{gtk-recent-chooser-menu-set-show-numbers} instead.
\begin{itemize}
  \item \texttt{chooser}  a \texttt{<gtk-recent-chooser>}
  \item \texttt{show-numbers}  ‘#t’ to show numbers, ‘#f’ otherwise
\end{itemize}
Since 2.10

\texttt{gtk-recent-chooser-get-show-numbers} \texttt{[Function]}
\begin{itemize}
  \item \texttt{(self <gtk-recent-chooser>)} \texttt{⇒ (ret bool)}
\end{itemize}
\texttt{get-show-numbers}  \texttt{[Method]}
Returns whether \texttt{chooser} should display recently used resources prepended by a unique number.
Do not use this function: use \texttt{gtk-recent-chooser-menu-get-show-numbers} instead.
\begin{itemize}
  \item \texttt{chooser}  a \texttt{<gtk-recent-chooser>}
  \item \texttt{ret}  ‘#t’ if the recent chooser should show display numbers, ‘#f’ otherwise.
\end{itemize}
Since 2.10

\texttt{gtk-recent-chooser-set-sort-type} \texttt{[Function]}
\begin{itemize}
  \item \texttt{(self <gtk-recent-chooser>)} \texttt{(sort_type <gtk-recent-sort-type>)}
\end{itemize}
\texttt{set-sort-type}  \texttt{[Method]}
Changes the sorting order of the recently used resources list displayed by \texttt{chooser}.
\begin{itemize}
  \item \texttt{chooser}  a \texttt{<gtk-recent-chooser>}
  \item \texttt{sort-type}  sort order that the chooser should use
\end{itemize}
Since 2.10
Chapter 148: GtkRecentChooser

```c
gtk-recent-chooser-get-sort-type (self <gtk-recent-chooser>) ⇒ (ret <gtk-recent-sort-type>)
```

**get-sort-type**

Gets the value set by `gtk-recent-chooser-set-sort-type`.

- **chooser** a `<gtk-recent-chooser>`
- **ret** the sorting order of the `chooser`.

Since 2.10

```c
gtk-recent-chooser-set-current-uri (self <gtk-recent-chooser>) (uri mchars) ⇒ (ret bool)
```

**set-current-uri**

Sets `uri` as the current URI for `chooser`.

- **chooser** a `<gtk-recent-chooser>`
- **uri** a URI
- **error** return location for a `<g-error>`, or ‘#f’
- **ret** ‘#t’ if the URI was found.

Since 2.10

```c
gtk-recent-chooser-get-current-uri (self <gtk-recent-chooser>) ⇒ (ret mchars)
```

**get-current-uri**

Gets the URI currently selected by `chooser`.

- **chooser** a `<gtk-recent-chooser>`
- **ret** a newly allocated string holding a URI.

Since 2.10

```c
gtk-recent-chooser-get-current-item (self <gtk-recent-chooser>) ⇒ (ret <gtk-recent-info>)
```

**get-current-item**

Gets the `<gtk-recent-info>` currently selected by `chooser`.

- **chooser** a `<gtk-recent-chooser>`
- **ret** a `<gtk-recent-info>`. Use `gtk-recent-info-unref` when you have finished using it.

Since 2.10

```c
gtk-recent-chooser-select-uri (self <gtk-recent-chooser>)
  (uri mchars) ⇒ (ret bool)
```

**select-uri**

Selects `uri` inside `chooser`.

- **chooser** a `<gtk-recent-chooser>`
- **uri** a URI
error  return location for a `<g-error>`, or `'#f'
ret   `'#t' if uri was found.

Since 2.10

`gtk-recent-chooser-unselect-uri (self <gtk-recent-chooser>)` [Function]

`unselect-uri` [Method]
Unselects uri inside chooser.

`chooser` a `<gtk-recent-chooser>`
`uri` a URI

Since 2.10

`gtk-recent-chooser-select-all (self <gtk-recent-chooser>)` [Function]

`select-all` [Method]
Selects all the items inside chooser, if the chooser supports multiple selection.

`chooser` a `<gtk-recent-chooser>`

Since 2.10

`gtk-recent-chooser-unselect-all (self <gtk-recent-chooser>)` [Function]

`unselect-all` [Method]
Unselects all the items inside chooser.

`chooser` a `<gtk-recent-chooser>`

Since 2.10

`gtk-recent-chooser-get-items (self <gtk-recent-chooser>)` [Function]

⇒ (ret glist-of)

`get-items` [Method]
Gets the list of recently used resources in form of `<gtk-recent-info>` objects.
The return value of this function is affected by the "sort-type" and "limit" properties of chooser.

`chooser` a `<gtk-recent-chooser>`
`ret` A newly allocated list of `<gtk-recent-info>` objects. You should use `gtk-recent-info-unref` on every item of the list, and then free the list itself using `g-list-free`.

Since 2.10

`gtk-recent-chooser-add-filter (self <gtk-recent-chooser>)` [Function]

`add-filter` [Method]
Adds filter to the list of `<gtk-recent-filter>` objects held by chooser.
If no previous filter objects were defined, this function will call `gtk-recent-chooser-set-filter`. 
Chapter 148: GtkRecentChooser

```plaintext
chooser  a <gtk-recent-chooser>
filter   a <gtk-recent-filter>
```

Since 2.10

```plaintext
gtk-recent-chooser-remove-filter (self <gtk-recent-chooser>) (filter <gtk-recent-filter>) [Function] remove-filter [Method]
  Removes filter from the list of <gtk-recent-filter> objects held by chooser.
  chooser  a <gtk-recent-chooser>
  filter   a <gtk-recent-filter>
```

Since 2.10

```plaintext
gtk-recent-chooser-list-filters (self <gtk-recent-chooser>) ⇒ (rets g-slist-of) list-filters [Method]
  Gets the <gtk-recent-filter> objects held by chooser.
  chooser  a <gtk-recent-chooser>
  ret      A singly linked list of <gtk-recent-filter> objects. You should just free the returned list using g-slist-free.
```

Since 2.10

```plaintext
  Sets filter as the current <gtk-recent-filter> object used by chooser to affect the displayed recently used resources.
  chooser  a <gtk-recent-chooser>
  filter   a <gtk-recent-filter>
```

Since 2.10

```plaintext
gtk-recent-chooser-get-filter (self <gtk-recent-chooser>) ⇒ (ret <gtk-recent-filter>) get-filter [Method]
  Gets the <gtk-recent-filter> object currently used by chooser to affect the display of the recently used resources.
  chooser  a <gtk-recent-chooser>
  ret      a <gtk-recent-filter> object.
```

Since 2.10
149 GtkRecentChooserDialog

Displays recently used files in a dialog

149.1 Overview

<gtk-recent-chooser-dialog> is a dialog box suitable for displaying the recently used documents. This widget works by putting a <gtk-recent-chooser-widget> inside a <gtk-dialog>. It exposes the <gtk-recent-chooser-iface> interface, so you can use all the <gtk-recent-chooser> functions on the recent chooser dialog as well as those for <gtk-dialog>.

Note that <gtk-recent-chooser-dialog> does not have any methods of its own. Instead, you should use the functions that work on a <gtk-recent-chooser>.

In the simplest of cases, you can use the following code to use a <gtk-recent-chooser-dialog> to select a recently used file:

```c
GtkWidget *dialog;

dialog = gtk_recent_chooser_dialog_new ("Recent Documents",
parent_window,
GTK_STOCK_CANCEL, GTK_RESPONSE_CANCEL,
GTK_STOCK_OPEN, GTK_RESPONSE_ACCEPT,
NULL);

if (gtk_dialog_run (GTK_DIALOG (dialog)) == GTK_RESPONSE_ACCEPT)
{
    GtkRecentInfo *info;

    info = gtk_recent_chooser_get_current_item (GTK_RECENT_CHOOSER (dialog));
    open_file (gtk_recent_info_get_uri (info));
    gtk_recent_info_unref (info);
}

gtk_widget_destroy (dialog);
```

Recently used files are supported since GTK+ 2.10.

149.2 Usage

<gtk-recent-chooser-dialog> [Class]

Derives from <gtk-recent-chooser>, <gtk-dialog>.

This class defines no direct slots.
150 GtkRecentChooserMenu

Displays recently used files in a menu

150.1 Overview

<gtk-recent-chooser-menu> is a widget suitable for displaying recently used files inside a menu. It can be used to set a sub-menu of a <gtk-menu-item> using gtk-menu-item-set-submenu, or as the menu of a <gtk-menu-tool-button>.

Note that <gtk-recent-chooser-menu> does not have any methods of its own. Instead, you should use the functions that work on a <gtk-recentchooser>.

Note also that <gtk-recent-chooser-menu> does not support multiple filters, as it has no way to let the user choose between them as the <gtk-recent-chooser-widget> and <gtk-recent-chooser-dialog> widgets do. Thus using gtk-recent-chooser-add-filter on a <gtk-recent-chooser-menu> widget will yield the same effects as using gtk-recent-chooser-set-filter, replacing any currently set filter with the supplied filter; gtk-recent-chooser-remove-filter will remove any currently set <gtk-recent-filter> object and will unset the current filter; gtk-recent-chooser-list-filters will return a list containing a single <gtk-recent-filter> object.

Recently used files are supported since GTK+ 2.10.

150.2 Usage

<gtk-recent-chooser-menu> [Class]

Derives from <gtk-recent-chooser>, <gtk-menu>.

This class defines the following slots:

show-numbers

Whether the items should be displayed with a number

gtk-recent-chooser-menu-new ⇒ (ret <gtk-widget>) [Function]

Creates a new <gtk-recent-chooser-menu> widget.

This kind of widget shows the list of recently used resources as a menu, each item as a menu item. Each item inside the menu might have an icon, representing its MIME type, and a number, for mnemonic access.

This widget implements the <gtk-recent-chooser> interface.

This widget creates its own <gtk-recent-manager> object. See the gtk-recent-chooser-menu-new-for-manager function to know how to create a <gtk-recent-chooser-menu> widget bound to another <gtk-recent-manager> object.

ret a new <gtk-recent-chooser-menu>

Since 2.10
151 GtkRecentChooserWidget

Displays recently used files

151.1 Overview
<gtk-recent-chooser-widget> is a widget suitable for selecting recently used files. It is the main building block of a <gtk-recent-chooser-dialog>. Most applications will only need to use the latter; you can use <gtk-recent-chooser-widget> as part of a larger window if you have special needs.

Note that <gtk-recent-chooser-widget> does not have any methods of its own. Instead, you should use the functions that work on a <gtk-recent-chooser>.

Recently used files are supported since GTK+ 2.10.

151.2 Usage
<gtk-recent-chooser-widget> [Class]
Derives from <gtk-recent-chooser>, <gtk-vbox>. This class defines no direct slots.

gtk-recent-chooser-widget-new ⇒ (ret <gtk-widget>) [Function]
Creates a new <gtk-recent-chooser-widget> object. This is an embeddable widget used to access the recently used resources list.

ret a new <gtk-recent-chooser-widget>

Since 2.10
152 GtkRecentFilter

A filter for selecting a subset of recently used files

152.1 Overview

A <gtk-recent-filter> can be used to restrict the files being shown in a <gtk-recent-chooser>. Files can be filtered based on their name (with gtk-recent-filter-add-pattern), on their mime type (with gtk-file-filter-add-mime-type), on the application that has registered them (with gtk-recent-filter-add-application), or by a custom filter function (with gtk-recent-filter-add-custom).

Filtering by mime type handles aliasing and subclassing of mime types; e.g. a filter for text/plain also matches a file with mime type application/rtf, since application/rtf is a subclass of text/plain. Note that <gtk-recent-filter> allows wildcards for the subtype of a mime type, so you can e.g. filter for image/*.

Normally, filters are used by adding them to a <gtk-recent-chooser>, see gtk-recent-chooser-add-filter, but it is also possible to manually use a filter on a file with gtk-recent-filter-filter.

Recently used files are supported since GTK+ 2.10.

152.2 Usage

<gtk-recent-filter> [Class]

Derives from <gtk-object>. This class defines no direct slots.

gtk-recent-filter-new ⇒ (ret <gtk-recent-filter>) [Function]

Creates a new <gtk-recent-filter> with no rules added to it. Such filter does not accept any recently used resources, so is not particularly useful until you add rules with gtk-recent-filter-add-pattern, gtk-recent-filter-add-mime-type, gtk-recent-filter-add-application, gtk-recent-filter-add-age. To create a filter that accepts any recently used resource, use:

```c
GtkRecentFilter *filter = gtk_recent_filter_new ();
gtk_recent_filter_add_pattern (filter, "*");
```

ret a new <gtk-recent-filter>

Since 2.10

gtk-recent-filter-get-name (self <gtk-recent-filter>) [Function]

get-name [Method]

Gets the human-readable name for the filter. See gtk-recent-filter-set-name.

filter a <gtk-recent-filter>

ret the name of the filter, or '#f'. The returned string is owned by the filter object and should not be freed.

Since 2.10
gtk-recent-filter-set-name (self <gtk-recent-filter>)  [Function]
  (name mchars)
set-name  [Method]
  Sets the human-readable name of the filter; this is the string that will be displayed in
  the recently used resources selector user interface if there is a selectable list of filters.

  filter  a <gtk-recent-filter>
  name  then human readable name of filter

  Since 2.10

gtk-recent-filter-add-mime-type (self <gtk-recent-filter>)  [Function]
  (mime_type mchars)
add-mime-type  [Method]
  Adds a rule that allows resources based on their registered MIME type.

  filter  a <gtk-recent-filter>
  mime-type  a MIME type

  Since 2.10

gtk-recent-filter-add-pattern (self <gtk-recent-filter>)  [Function]
  (pattern mchars)
add-pattern  [Method]
  Adds a rule that allows resources based on a pattern matching their display name.

  filter  a <gtk-recent-filter>
  pattern  a file pattern

  Since 2.10

gtk-recent-filter-add-application (self <gtk-recent-filter>)  [Function]
  (application mchars)
add-application  [Method]
  Adds a rule that allows resources based on the name of the application that has
  registered them.

  filter  a <gtk-recent-filter>
  application  an application name

  Since 2.10

gtk-recent-filter-add-group (self <gtk-recent-filter>)  [Function]
  (group mchars)
add-group  [Method]
  Adds a rule that allows resources based on the name of the group to which they
  belong

  filter  a <gtk-recent-filter>
group  a group name

Since 2.10

gtk-recent-filter-add-age (self <gtk-recent-filter>) (days int)  [Function]
add-age  [Method]
  Adds a rule that allows resources based on their age - that is, the number of days elapsed since they were last modified.
filter  a <gtk-recent-filter>
days  number of days

Since 2.10

gtk-recent-filter-get-needed (self <gtk-recent-filter>)  [Function]
get-needed  [Method]
  Gets the fields that need to be filled in for the structure passed to gtk-recent-filter-filter
  This function will not typically be used by applications; it is intended principally for use in the implementation of <gtk-recent-chooser>.
filter  a <gtk-recent-filter>
ret  bitfield of flags indicating needed fields when calling gtk-recent-filter-filter

Since 2.10
Chapter 153: Undocumented

The following symbols, if any, have not been properly documented.

153.1 (gnome gtk)

<guile-gtk-tree-model> [Class]
create-tag [Generic]
create-tag (buffer <gtk-text-buffer>) (tag-name <top>) [Method]
                   (properties <top>)...

gtk-stock-id nick [Function]
gtk-text-buffer-create-tag buffer tag-name . properties [Function]
gtk-tree-or-list-store-set store iter . args [Function]
on-get-column-type [Generic]
on-get-flags [Generic]
on-get-flags (obj <guile-gtk-generic-tree-model>) [Method]
on-get-iter [Generic]
on-get-n-columns [Generic]
on-get-path [Generic]
on-get-value [Generic]
on-iter-children [Generic]
on-iter-has-child [Generic]
on-iter-n-children [Generic]
on-iter-next [Generic]
on-iter-nth-child [Generic]
on-iter-parent [Generic]

153.2 (gnome gw gtk)
